

Simple GitHub Howto (method #2)

This is a simple howto explaining how to add or edit a file in iLCSoft/lcgeo using only the GitHub web interface. This method would be best suited for minor changes, like fixing typos, changing a parameter, etc.

First, we create a fork of iLCSoft/lcgeo by clicking the 'Fork' button on the top right corner:

[blocked URL](#)

Then, in the popup dialog, we click my avatar to create protopopescu/lcgeo. **If the fork is already there, make sure it's up to date, else you will have to rebase it and it's not possible from within the browser.** The title in the top left will now say

[blocked URL](#)

Let's now navigating to the file we want to edit, and click the 'Edit' icon like this

[blocked URL](#)

We edit the file in the browser, and when finished we scroll down, and fill the commit title and comments

[blocked URL](#)

We want to commit to the master in this case, since the master is actually our fork. Click 'Commit changes' and we're done here.

We notice at the top right a 'Pull request' option

[blocked URL](#)

We click it and are presented with

[blocked URL](#)

We click the green button, add a title and comments for this pull request, and click 'Create pull request' button. Once the pull request is approved, the changes will go into the iLCSoft/lcgeo master
