

BaBar Computing Needs going into the future

by Homer Neal

for the

SLAC Scientific Computing Workshop

20 June 2011

on behalf of all of the BaBar LTDA contributors

(BaBar LTDA/BaBar management/SLAC Computing Division/LTDA
Advisory Committee)

Current and Projected Analysis Activity

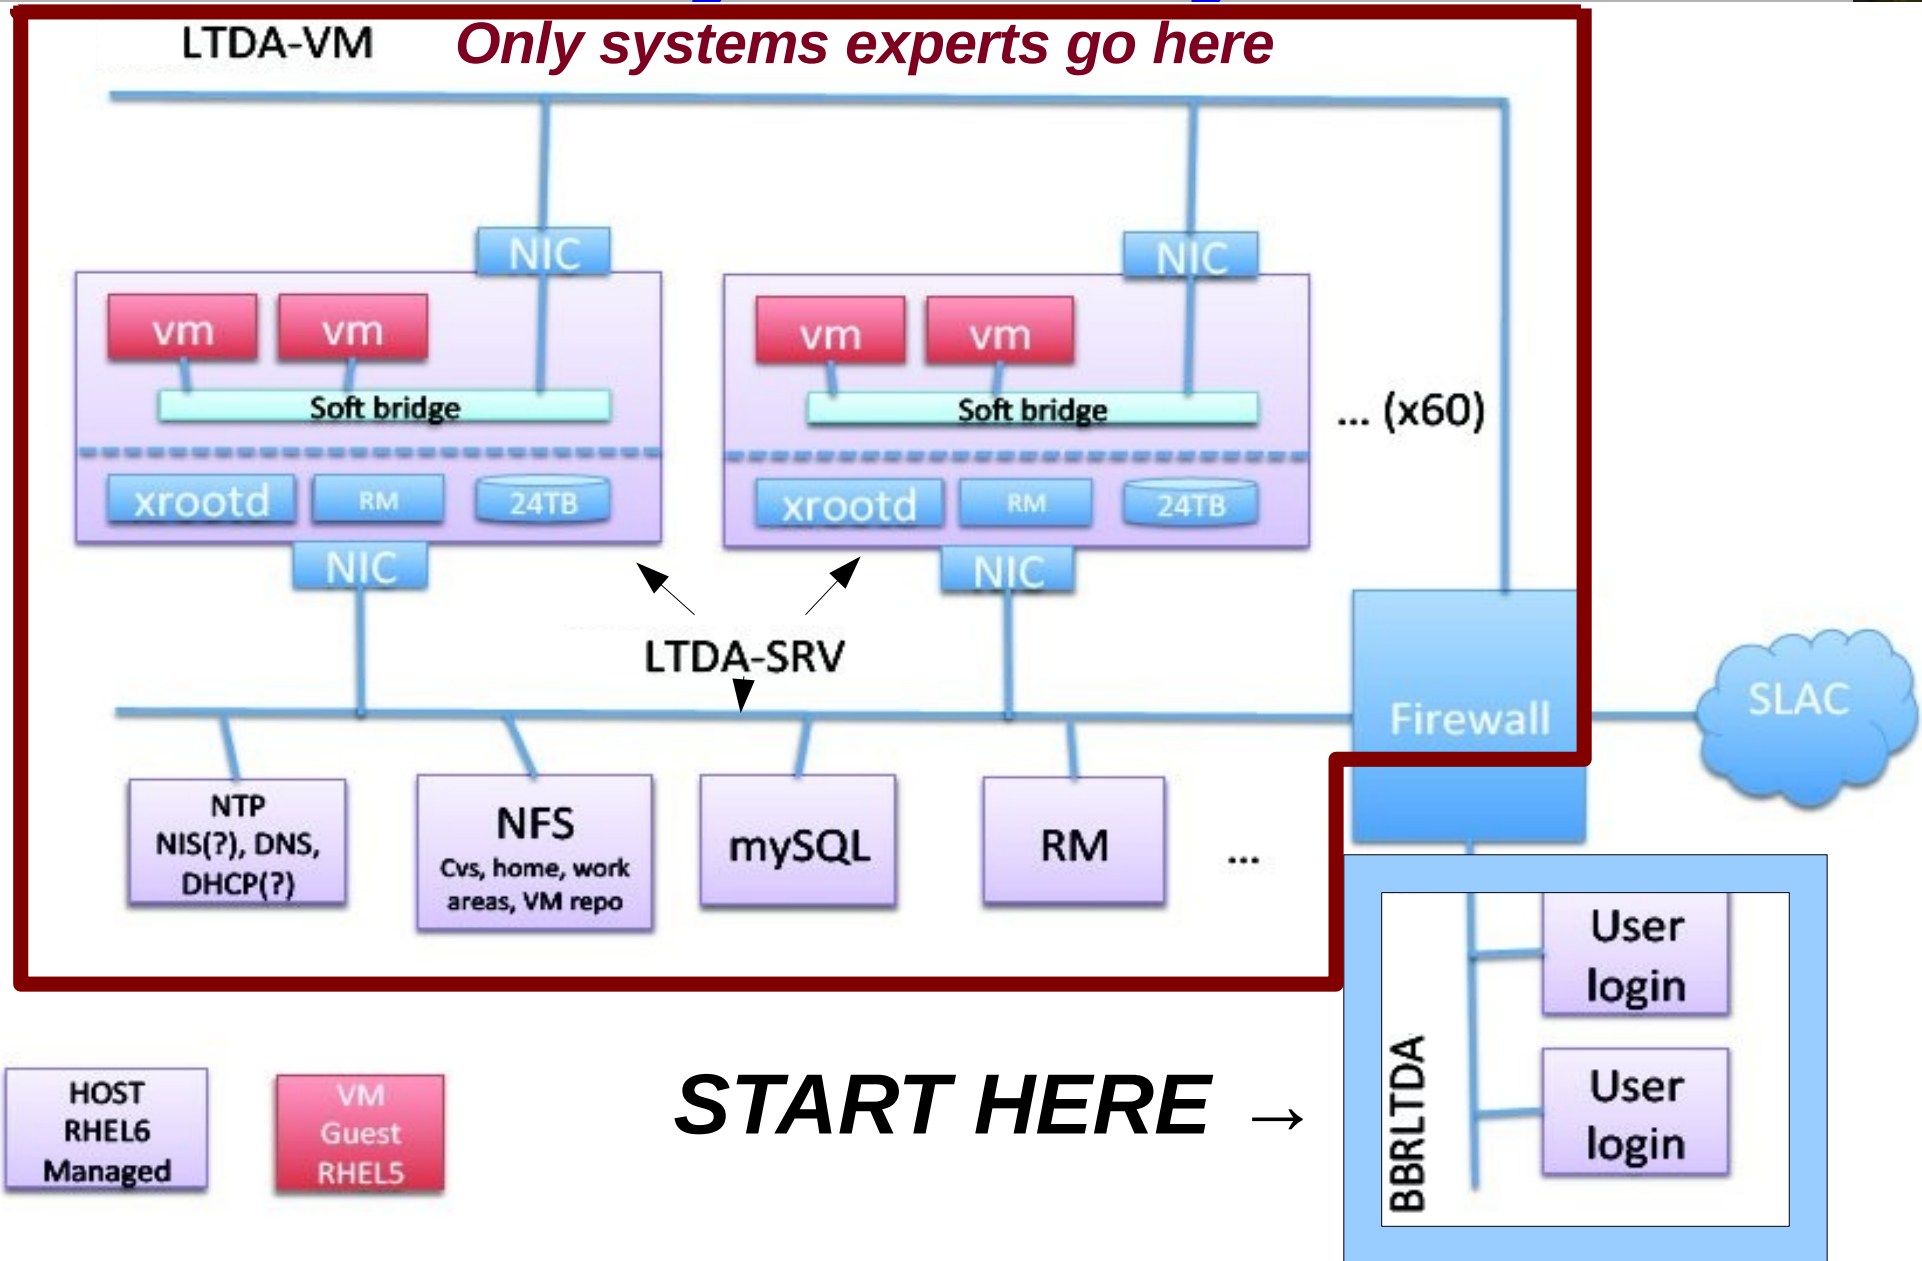

- BaBar has collected good data from Oct 22nd 1999 to Apr 7th 2008
 - 800TB of raw data, 1.2 PB from the last data reprocessing
 - 453 published papers to date
 - ~120 active analyses
- Physics Analysis profile
 - Provide support for >50 publications foreseen beyond 2012

Providing for the future needs

- Must maintain stable, trusted validated platform for future analyses
- SLAC must roll-out new secure platforms
- Ability to keep-up with no platforms is almost lost; a significant problem with running BaBar code on a new platform could kill the ability to analyse the data or produce new signals OR the results would simply be questionable
- Large infrastructure currently used by BaBar will change and share is dwindling
- Hence ... the creation of the BaBar Archival System

The System Layout

Hardware

- 60 servers Intel dual 6-core, 3GHz, 48GB RAM, 24TB disk
 - 4 existing systems in prototype
 - Purchase remaining systems in 2 stages
- Cisco 6506 network switch
- NFS server
- A few dedicated infrastructure & login servers
- Distributed storage and computing resources
 - Each node provides both CPU and storage

Main Milestones 2010 → 2012

	Name	Start	Finish	2010		Qtr 4, 2010			Qtr 1, 2011			Qtr 2, 2011			Qtr 3, 2011			Qtr 4, 2011			Qtr 1, 2012			Qtr 2, 2012		
				Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun
1	CEP+PO LTDA Prototype	8/20/10 8:00 AM	9/30/10 5:00 PM																							
2	Installation/configuration complete	10/1/10 8:00 AM	12/31/10 5:00 PM																							
3	Run7 available for test users	1/1/11 9:00 AM	6/1/11 5:00 PM																							
4	Fix, test, tune, PO for final design	1/1/11 9:00 AM	6/1/11 5:00 PM																							
5	Extended system ready (25% to 50%)	6/2/11 8:00 AM	9/30/11 5:00 PM																							
6	100% system acquired	10/1/11 8:00 AM	1/31/12 5:00 PM																							
7	Deploy LTDA	2/1/12 9:00 AM	3/22/12 9:00 AM																							

- Sep 2010
 - PO for the prototype
 - Prototype on site by October
- Dec 2010
 - Installation/configuration complete
- Jan 1st 2011
 - System available for test users

DONE!

DONE!

DONE!

DONE!

- Jun 1st 2011
 - Test phase ends, LTDA final design ready
 - PO for first 50%
- Jul 1st 2011
 - First 50% of LTDA available
- Oct 1st 2011
 - PO for 100% of LTDA
- March, 21st, 2012
 - Deployment of the LTDA
 - All new analyses will use LTDA

Getting There!

The LTDA archival system – the fruit of many contributions

- Computing Management: Tina Cartaro
- Software expert and beta tester: Homer Neal
- Network design: Steffen Luitz
- Virtualization expert: Kyle Fransham
- System performance expert: Igor Gaponenko
- Databases, tools and production: Douglas Smith
- Tools and environment: Tim Adye

- Computing Division experts
 - System setup and administration: Booker Bense and Lance Nakata
 - XrootD experts: Wilko Kroeger and Andy Hanuchevsky
 - Network setup: Antonio Ceseracciu
 - BaBar-SLAC liaison: Len Moss

–PPA and BaBar Management

plus strong backing from the BaBar management (Mike, Tina and Steve) and the SLAC PPA management (David and Bill), wiki documentation managers Matt and Adam, the advisory committee (special thanks to Fabrizio) and others,

Support of the Archival System

- **BaBar experts:**
 - Releases, databases, data management and documentation
 - The Collaboration will have to provide such expertise
- **Computing experts:**
 - Network architects, security, system and networks administration, virtualization, ...
 - 0.5 FTE/year foreseen after 2012

Status

- ★ Functional prototype system being thoroughly tested:
 - ★ Validated: **simulation, reconstruction and skimming** on the system
 - ★ Currently finishing work on setting up **simulation production**
 - ★ Currently testing the system by doing **analyses** from start to finish on it.
 - ★ Working on SL6 migration

The rest is supporting material

The starting point

- One connects to a login server « bbrltda » (this is your gateway to the archival system)
 - « bbrltda » is a pool of up-to-date machines from which all LTDA operations can be submitted.
-
- User access is controlled through an NIS netgroup (u-ltda). User's must have a kerberos ticket.
 - LDAP is used to manage the authentications

The Workers

- We currently have **4 – DELL R510 dual six core servers.** One serves special functions such as ldap, xrootd redirector, and PBS/torque.

- Three of the R510s are **worker nodes** on which the virtual machines run. We currently have 2 of the three configured with hyperthreading on.

The worker nodes

```
[homer@bbrrtda01 ~]$ qnodes | & egrep "srv|np|prop|jobs" | grep -v status
lt-da-srv002
  np = 12
  properties = ht
  jobs = 0/392.lt-da-srv001.slac.stanford.edu, 1/393.lt-da-srv001.slac.stanford.edu, 2/394.lt-da-
  srv001.slac.stanford.edu, 3/395.lt-da-srv001.slac.stanford.edu, 4/396.lt-da-
  srv001.slac.stanford.edu, 5/397.lt-da-srv001.slac.stanford.edu, 6/398.lt-da-
  srv001.slac.stanford.edu, 7/399.lt-da-srv001.slac.stanford.edu, 8/400.lt-da-
  srv001.slac.stanford.edu, 9/401.lt-da-srv001.slac.stanford.edu
lt-da-srv003
  np = 12
  properties = ht
lt-da-srv004
  np = 12
  properties = noht
```

VM JOBS RUNNING

- **The worker nodes also are the storage servers for the data collections**
- Data is accessed through **xrootd** and non-local collections are staged in from our **hpss** tape system by **xrootd**.

NFS storage

- We also have a SUN x4540 acting as our nfs server for data needing RAID protection
- Analysis working group areas
- Simulation production
- Skimming production

```
[bbrltda01] ~/rel-24.5.7/workdir $ amdmap wain062  
wain062: /nfs/ltda/awg/AWGL001  
wain062: /nfs/ltda/awg/AWGL002  
wain062: /nfs/ltda/awg/AWGL003  
wain062: /nfs/ltda/awg/AWGL004  
wain062: /nfs/ltda/prod/simu001  
wain062: /nfs/ltda/prod/simu002  
wain062: /nfs/ltda/prod/skim001  
wain062: /nfs/ltda/prod/skim002
```

Output from the vm jobs are written to one of these areas. Writing to the home areas is blocked for security reasons.

NFS storage (code, applications, repositories)

- Software releases
- Root
- User home directories
- CVS
- ...

```
wain062:/ltda/BFROOT/bin  
wain062:/ltda/BFROOT/build  
wain062:/ltda/BFROOT/dist  
wain062:/ltda/BFROOT/hepik  
wain062:/ltda/BFROOT/kanga  
wain062:/ltda/BFROOT/package  
wain062:/ltda/BFROOT/prod  
wain062:/ltda/BFROOT/physicstools  
wain062:/ltda/BFROOT/reco  
wain062:/ltda/BFROOT/repo  
wain062:/ltda/BFROOT/simu  
wain062:/ltda/BFROOT/work  
wain062:/ltda/home/...
```

+ a node for the login server

Job Management

- Explored using condor/nimbus/torrent but the system was too unstable
- Now **PBS/torque** is used as the batch system
 - Easier to maintain

```
[homer@bbrltda01 workdir]$ qstat -r
```

1st Stress Test

```
ltda-srv001.slac.stanford.edu:
```

Job ID Time	Username	Queue	Jobname	Req'd SessID	Req'd NDS	Elap TSK	Memory	Time	S

With the **qcow (qemu-copy-on-write)** images it takes less than 2 minutes to fill up the system with jobs

Monitoring

i/o, load, space, etc... is all monitored by Ganglia

Virtual Debugging

- In case of problems that are platform dependent ...

- The virtual world is also the place to code releases

```
[homer@bbrltda01 workdir]$ qsub -l  
qsub: waiting for job 623.ltda-srv001.slac.stanford.edu to start  
qsub: job 623.ltda-srv001.slac.stanford.edu ready
```

```
-----  
TORQUE PROLOGUE:  
jobid:          623.ltda-srv001.slac.stanford.edu  
userid:         homer  
requested resources: neednodes=1,nodes=1,walltime=01:00:00  
queue:          batch  
host:           bbr-ltda-vm005  
-----
```

```
Starting virtual machine... please wait  
VM is ready. Connecting...
```

```
bash-3.2$ which MooseApp  
/BFROOT/dist/releases/current/bin/Linux26SL5_i386_gcc412/MooseApp  
bash-3.2$ gdb MooseApp  
GNU gdb (GDB) Red Hat Enterprise Linux (7.0.1-23.el5_5.1)  
Copyright (C) 2009 Free Software Foundation, Inc.  
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>  
This is free software: you are free to change and redistribute it.

and "show warranty" for details.  
This GDB was configured as "i386-redhat-linux-gnu".  
For bug reporting instructions, please see:  
<http://www.gnu.org/software/gdb/bugs/>...  
Reading symbols from /BFROOT/dist/releases/24.5.7/bin/Linux26SL5_i386_gcc412/MooseApp...done.  
(gdb)
```

This does everything you need. Next stop ... the virtual world.

AFS

- No AFS access from the VM's:
 - It is a security concern and also given that the archival system is intended to be as modular as possible, keeping AFS access would lead to strong/irresistable dependencies on the general SLAC infrastructure
- However, in order to maintain the servers, the servers themselves must have AFS access.

Analysis Job Performance

- SLAC's next to last generation batch workers (**fells**):
 - Intel(R) Xeon(R) CPU X5355 @ 2.66GHz
 - Total CPU usage: **7239** User: 7204 System: 35
- SLAC's latest generation batch workers (**hequs**):
 - Intel(R) Xeon(R) CPU X5570 @ 2.93GHz
 - Total CPU usage: **4756** User: 4718 System: 38
- LTDA VM running on an R510:
 - QEMU Virtual CPU version 0.9.1
 - w/hyperthreading
 - Total CPU usage: **6544** User: 6421 System: 123
 - w/o hyperthreading
 - Total CPU usage: **5295** User: 5207 System: 88

*Study in progress
to understand this*

Other related data preservation news

- Migration to new media completely done
- Old tapes stored away safely
- Backing up active data to ccin2p3
- Tape library for accessing raw data copy at Padova restored
- First time central backup of AWG areas
- History of analyses being preserved in the joint BaBar/BELLE physics of B-factories book (PBF)

2012	Pictures Gallery

Over the last decade BaBar and Belle have studied the physics of bottom and charm mesons, tau leptons, heavy quarkonium states, etc. that were produced at the PEP-II and KEKB e+e- storage rings. The two collaborations continuously developed more and more sophisticated techniques for extracting the maximum amount of information from data.

Often these techniques have been used in many analyses. However, as most of BaBar's and Belle's 600+ publications are in Physical Review Letters, Physical Review D Rapid Communications, and Physics Letters where the page limits imposed by the journals do not allow for a full description of the analyses, many details of this work have never been published. The Physics of the B-Factories will address this problem by providing descriptions of all of the techniques developed by the experiments, and a comprehensive overview of the measurements. This will provide an essential reference for physicists working at the next generation of Super Flavour Factories.

The book will bring together all of the work done by both collaborations in a single comprehensive collection. As no such work would be complete without discussing the theoretical implications of the measurements performed, there will also be a significant review of the associated theory. Thus, the full impact that the B-Factories and the associated theoretical progress have had on the field of high energy physics will be reviewed through this work.

Documentation

- The Documentation Working Group (**DWG**) headed by Adam and Matt has been successful in getting people to get up-to-date clean documentation on the BaBar LTDA wiki.

(The wiki runs on a server outside the archival system because of the need to retain access even during outages of the archival system)

Physics analysis/Yns 1001

< Physics analysis

Search for $A^0 \rightarrow \gamma\gamma$ from $\Upsilon(1S) \rightarrow \gamma A^0$ with $\Upsilon(2S) \rightarrow \pi^+\pi^-\Upsilon(1S)$

(Note: the plot above is for $\Upsilon(2S) \rightarrow \pi^+\pi^-\Upsilon(1S), \Upsilon(1S) \rightarrow \gamma A^0(8.75)$, $A^0 \rightarrow$ invisible, it will soon be replaced by $A^0 \rightarrow \gamma\gamma$)

Contents [show]

Analysts

- Homer Neal
- Arafat Gabareen

Other documentation

Outstanding issues

- $A^0 \rightarrow$ invisible and $A^0 \rightarrow \tau\tau$ exist but no $A^0 \rightarrow \gamma\gamma$
- starting with analysis-52 on the LTDA prototype and intend to migrate to analysis-53 as soon as it is available
- plan to use viewpoints visualization to best means of isolating the signal
- working area is /home/homer/rel-24.5.7/workdir from the bbrltda login pool
- jobs are submitted using subq <collection>

```
[homer@bbrltda01 workdir]$ ssh homer@lt-da-srv002 ls -l /u1/store/SP/R24/009016/run7/24.2.1p/SP_009016_033703.*
lrwxrwxrwx 1 bbdatsrv br 41 Apr 14 07:43 /u1/store/SP/R24/009016/run7/24.2.1p/SP_009016_033703_01.root -> /u2/cache/public/17/58E3A44D070000000086*

[homer@bbrltda01 workdir]$ subq /store/SP/R24/009016/run7/24.2.1p/SP_009016_033703
757:lt-da-srv001.slac.stanford.edu
lt-da-srv003
```

Analysis Journaling

```
ltda-st0001
state = free
np = 12
properties = ht
ntype = cluster
jobs = 0/758.ltda-srv001.slac.stanford.edu
status = rectime=1305331665,varattr=,jobs=758.ltda-srv001.slac.stanford.edu,state=free,netload=249593993365,gres=,loadave=0.22,ncpus=12,physmem=49450772kb,availmem=57150368kb,totmem=57836692kb,idletime=17821,nusers=3,nsessions=5,sessions=506 6750 6916 7073 9493,uname=Linux ltda-
gpus = 0
-- -- --
```

• Output goes here:

```
/avg/AMGL001/homer/output
~/r-f-r+ $ homer bfact-a 54902 May 13 17:09 A0qan-SP_009016_033703-QA.root
```

Lessons learned ... so far ...

- Easy to get trapped in unexpected details (security!) 
- Beware of unexpected costs (licenses!)
- Complete independence from the existing computing infrastructure is difficult to achieve and not necessarily desirable.
- Storage costs are not negligible
- No twisting of arms needed to get experts to voluntarily contribute

Data storage on worker nodes

```
