

Custom simulation for SPS data runs

	0 deg	30 deg	60 deg
282 GeV:	700001922,	700001942,	700001949
200 GeV:	700001911,	700001902,	700001909
100 GeV:	700001981,	700001999,	700002006
50 GeV:	700002034,	700002056,	700002064
20 GeV:	700002082 ,	700002096,	700002103

1 - Parameters modified in the MC configuration files to match the MC beam profile to that of the data

beamtest06

Gleam

2 - Data-MC comparisons of of beam profile for **700002082**¹

Gleam Job options

```
BeamTransform.point_on_beamline = {190.9, 33.4 , -47.0};  
BeamTransform.table_rotation=60.51;  
BeamTransform.table_tilt = 0.19;  
  
BeamTransform.OutputLevel = 0;  
  
GlastDetSvc.xmlfile="$(XMLGEODBSROOT)/xml/cu06/cu06SegVols.xml";  
HepRepSvc.GeometryDepth = 7;  
mcRootReaderAlg.OutputLevel=4;  
mcRootReaderAlg.clearOption = "ALL";  
mcRootWriterAlg.clearOption = "ALL";
```

(1)

(2)

(3)

(1) Beam incidence position (X,Y) at Z = -47mm

(2) Beam incidence angle in X direction

(3) Beam incidence angle in Y direction, recently implemented

These quantities are directly retrieved from inspection of data runs. Easy stuff (~ 1 minute)

For Tilt in Y direction (Leon suggestion):

GlastRelease v9r25

+ G4Generator v5r17p2gr0

+ TkrDigi v2r6

Detail: note that **table_rotation** (X direction) and **table_tilt** (Y direction) go with opposite signs

Tkr1XDir = - 0.870415443
Tkr1YDir = + 0.0033201057

Table_rotation = + 60.51
Table_tilt = + 0.19

Beamtest06 SPS job option

```
# Macro file for 2006 sps electron runs
# Sets some default verbose
/control/verbose 2
/run/initialize
/run/verbose 2

/Cern/random/run 0
/Cern/random/event 1

(2)

Beam divergence has to be tuned too !!

1.0 mrad → 0.25 mrad

Details in talk given on March 7

(1) Quantities derived from beam profile inspection (sigma_x, sigma_y) are not those values. No direct relation is known. Used approach is to simulate many beams and find those numbers iteratively...

I could find parameters which match profile data-mc:

Very good:

280 GeV (1922)

200 GeV (1911)

100 GeV (1981)

Rather good:

50 GeV (2039)

Not very good... but ok...:

20 GeV (2082)

In MC data, beam width and divergence increases “too much” as energy decreases. Reason not identified...

In MC data we know:

- a) The exact incoming direction of the beam
- b) The exact incoming direction of event i ($Mc[Z Y X]Dir$)

Therefore, we can compute, the following quantities:

$$\begin{aligned} \mathit{Cos}(\mathit{BeamCU_DirErr}) &= \mathit{cos}(\mathit{XthetaBeam}) * \mathit{Tkr1XDir} + \\ &\mathit{cos}(\mathit{YthetaBeam}) * \mathit{Tkr1YDir} + \\ &\mathit{cos}(\mathit{ZthetaBeam}) * \mathit{Tkr1ZDir} \end{aligned}$$

CU Resolution +
BeamDiv
("Measured PSF")

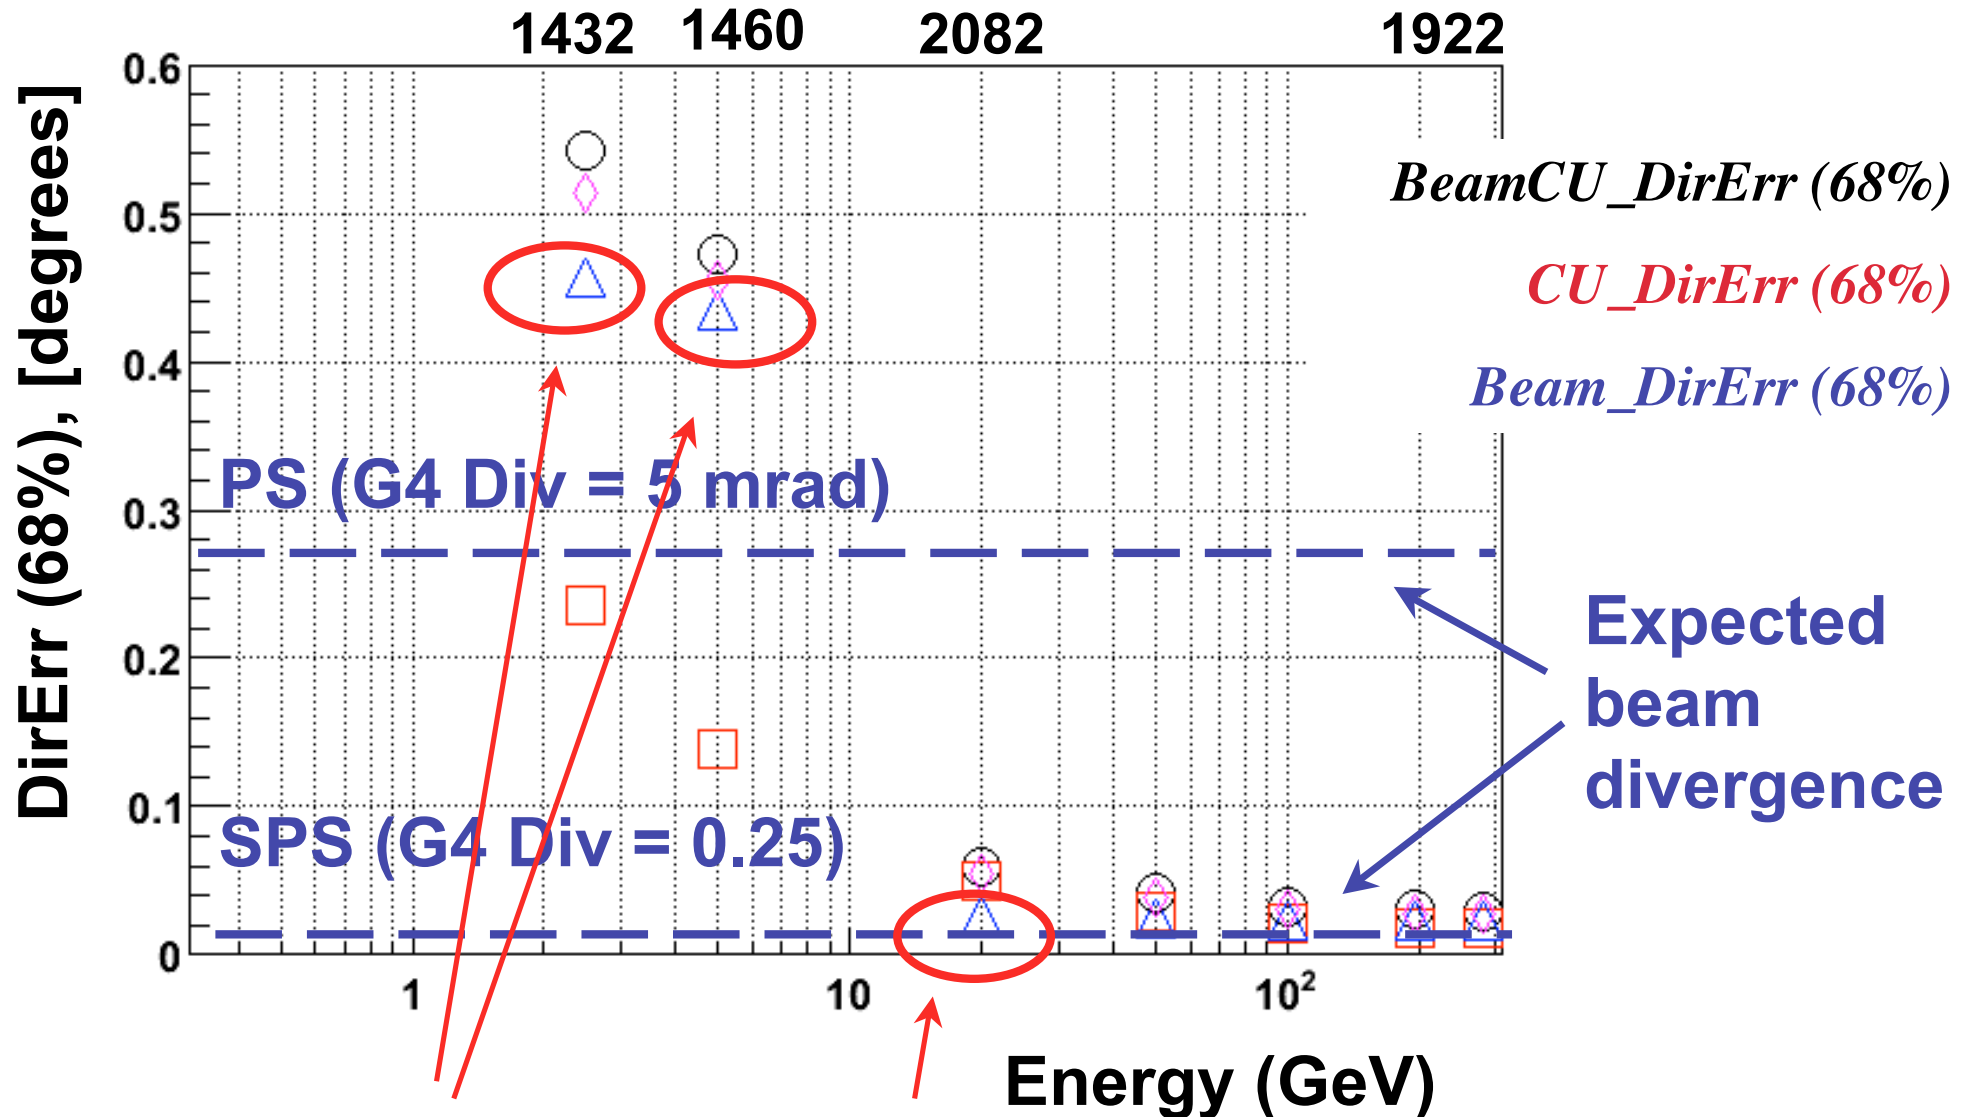

$$\begin{aligned} \mathit{Cos}(\mathit{CU_DirErr}) &= \mathit{McXDir} * \mathit{Tkr1XDir} + \\ &\mathit{McYDir} * \mathit{Tkr1YDir} + \\ &\mathit{McZDir} * \mathit{Tkr1ZDir} \end{aligned}$$

CU Resolution
(True PSF)

$$\begin{aligned} \mathit{Cos}(\mathit{BeamCU_DirErr}) &= \mathit{cos}(\mathit{XthetaBeam}) * \mathit{McXDir} + \\ &\mathit{cos}(\mathit{YthetaBeam}) * \mathit{McYDir} + \\ &\mathit{cos}(\mathit{ZthetaBeam}) * \mathit{McZDir} \end{aligned}$$

Beam
Divergence

BeamCU_DirErr (68%), CU_DirErr (68%) and Beam_DirErr (68%) vs Energy

Beam divergence in the “merit file” is higher than the one set in the G4 config file: unresolved issue

COMPARISON *DATA*-MC : *BeamCU_DirErr* (68%) vs Energy

1432 1460 2082 1922

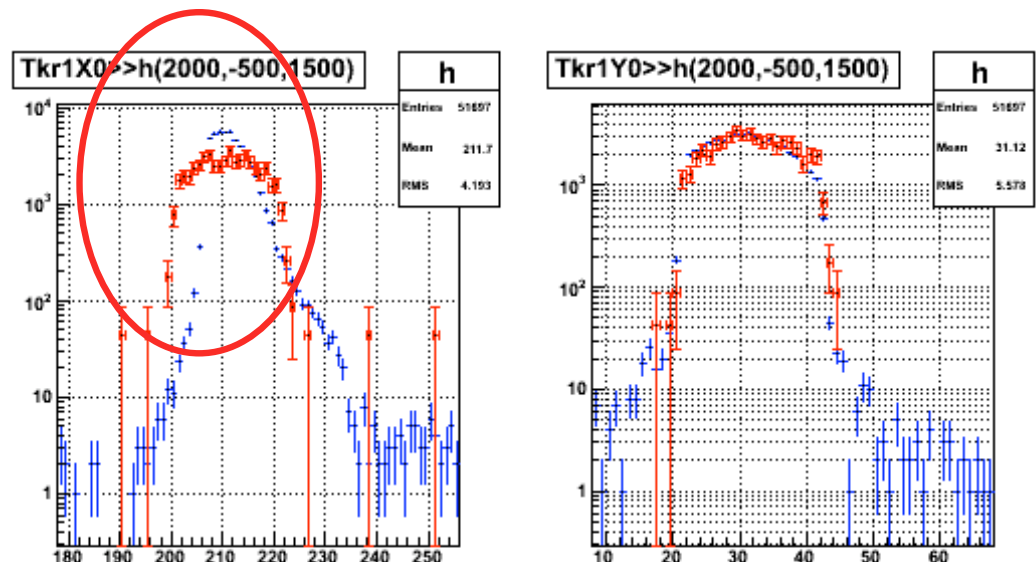

Below 100 GeV, Data has a lower BeamCU_DirErr than MC

Electron beam divergence (and beam width) increases when decreasing energy of electrons due to Coulomb scattering

This increase in beam divergence and dimensions is larger in the MC than in the data

Changing G4config parameters (divergence and beam dimensions) is not sufficient to get an exact matching of the beam profiles data-mc

In any case, the agreement is rather good (see next slides); so we decided to move forward

Quick Comparison data-mc for some parameters

Important remark

The only cuts applied to the data are :

1 - CalEnergyRaw > 10 MeV (No-empty events)

2 - TkrNumTracks > 0.5 (events with at least 1 track)

These are very simple cuts which are expected to be fulfilled by all the electrons (>20 GeV) entering in the calibration unit.

More sophisticated cuts (e.j. removing events crossing cracks, removing MIPs...) which might improve the agreement data-mc are NOT applied. These additional cuts must be applied with care, since they might also bias the comparison if not carefully done

Agreement in incoming directions is good, this is by construction...

ZOOM on plots from previous slide

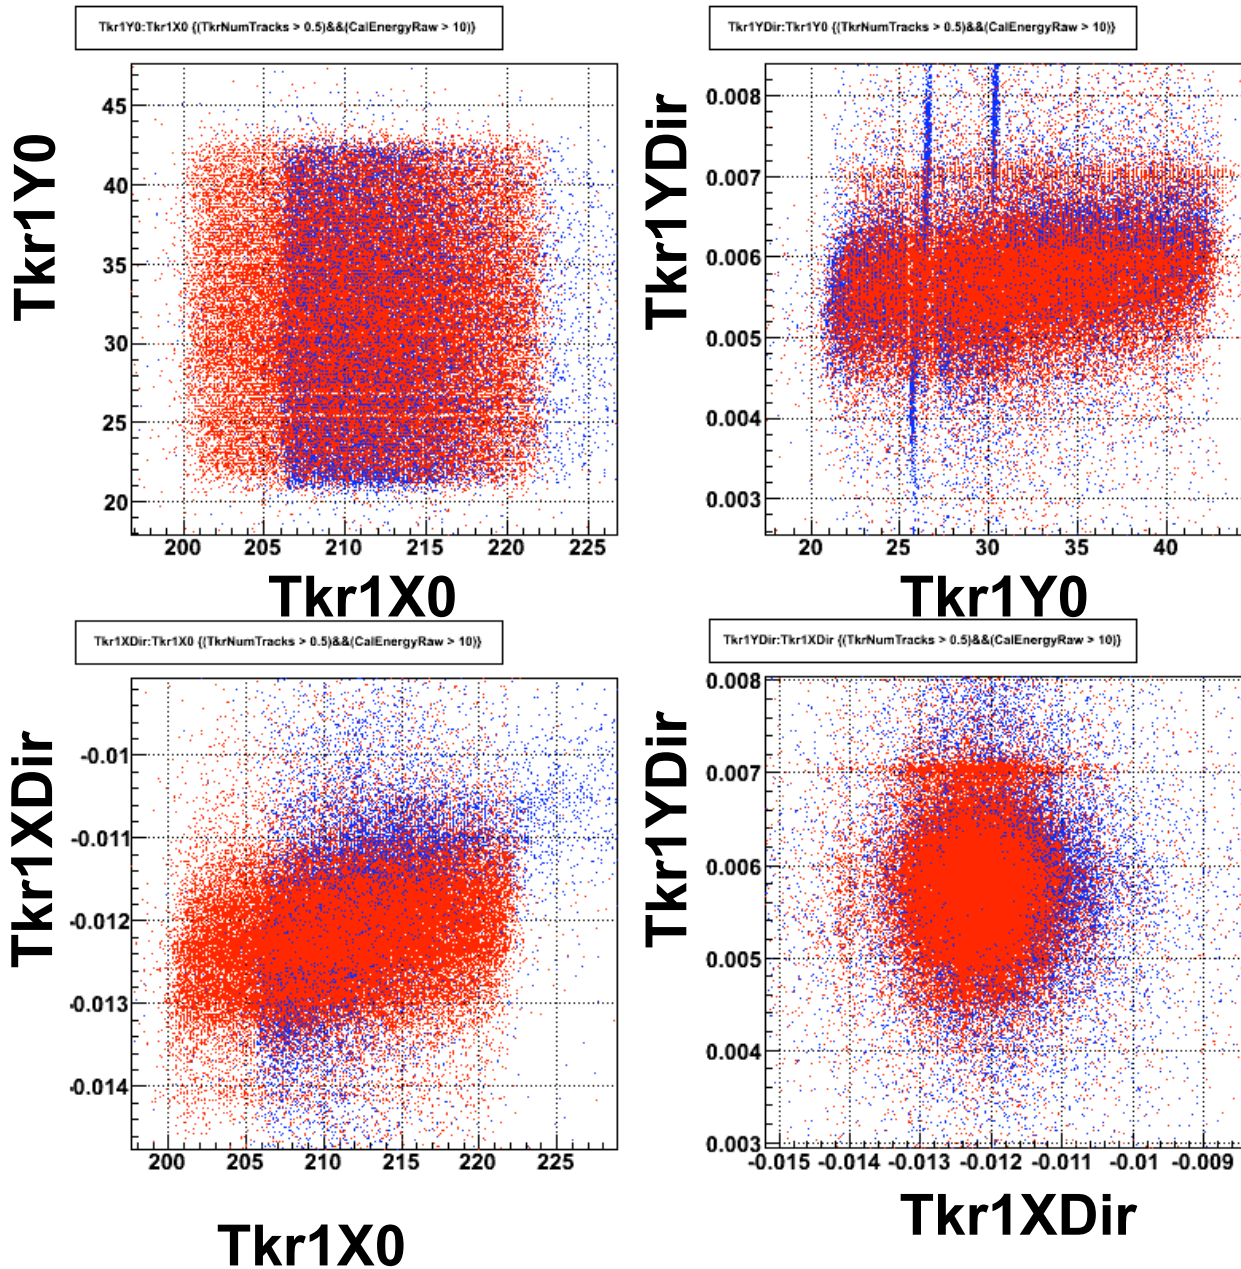

Bill-type scatter plots for the beam profile

Agreement is also good. Those scatter plots show more “dramatically” the tails of the distribution, where agreement is certainly not good

Spikes in Tkr1YDir: Tkr1Y0 plot are also clearly visible
