

**Angular resolution with
electrons (v1r030604p6) Vs
beam incoming direction**

Nicola Mazziotta

Sep 19, 2007

mazziotta@ba.infn.it

Introduction

- The angular resolution increases with the energy, i.e. it is less than 0.1° above 1 GeV.
- To evaluate the angular resolution with high energy electrons, the beam incoming direction must be well known, e.g. the beam direction cosine precision must be of order 10^{-6} or better (see David talk given on July 25th)
- A scanning procedure could be used to align the beam to the CU

CU-Beam Alignment

The alignment is performed by a scanning procedure starting from the nominal incoming beam direction defined by the first track cosine directions.

$$\left(\varphi_{beam}^{nominal}, \mathcal{G}_{beam}^{nominal} \right)$$

$$\left(\varphi_{beam}^{nominal} + \Delta\varphi, \mathcal{G}_{beam}^{nominal} + \Delta\mathcal{G} \right)$$

where

$$\Delta\varphi = \Delta\mathcal{G} = -1^\circ + Nstep * 0.01^\circ$$

Nstep = 0, 1,, 200

10 GeV – 0 deg

Class A.2.1 PSF (deg) Vs ($\Delta\phi$, $\Delta\theta$)

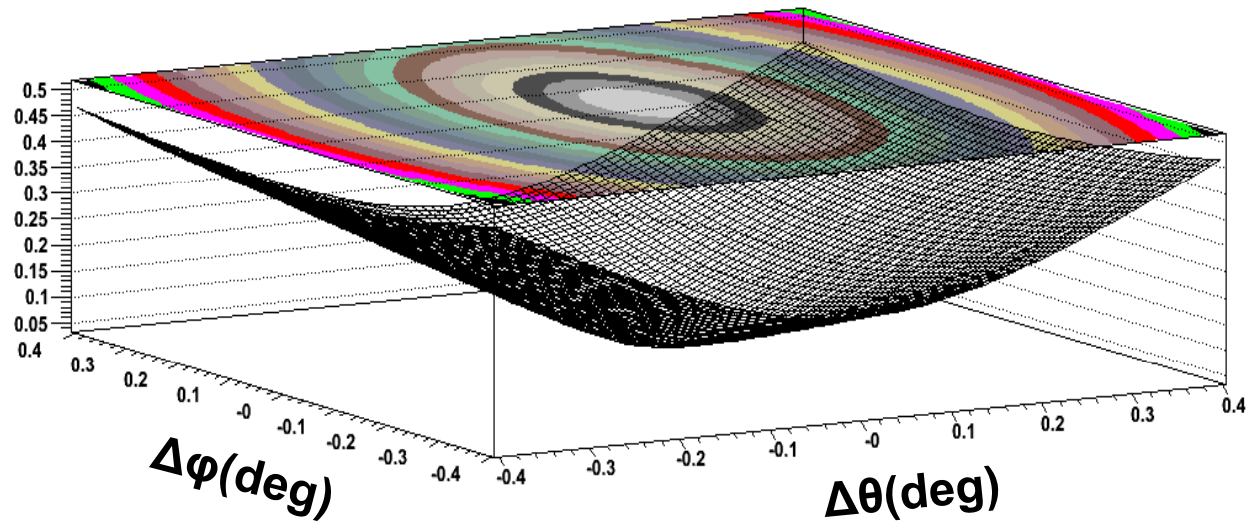

Class A.2.1 PSF (deg) Vs ($\Delta\phi$, $\Delta\theta$)

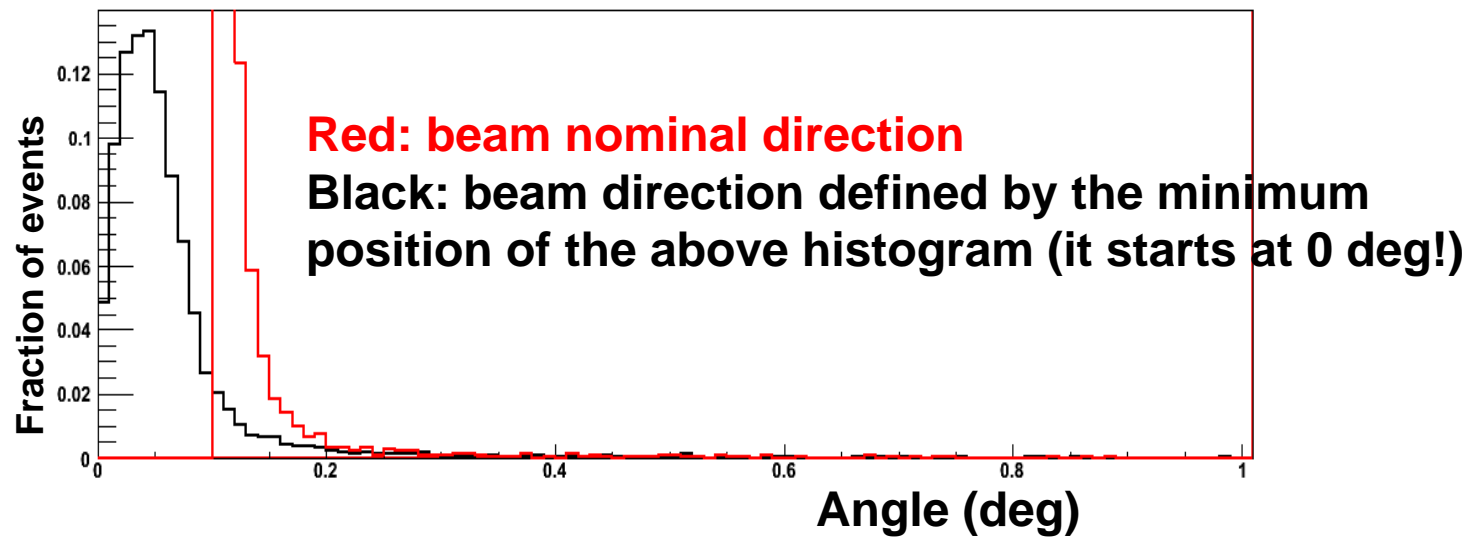

20 GeV – 30 deg

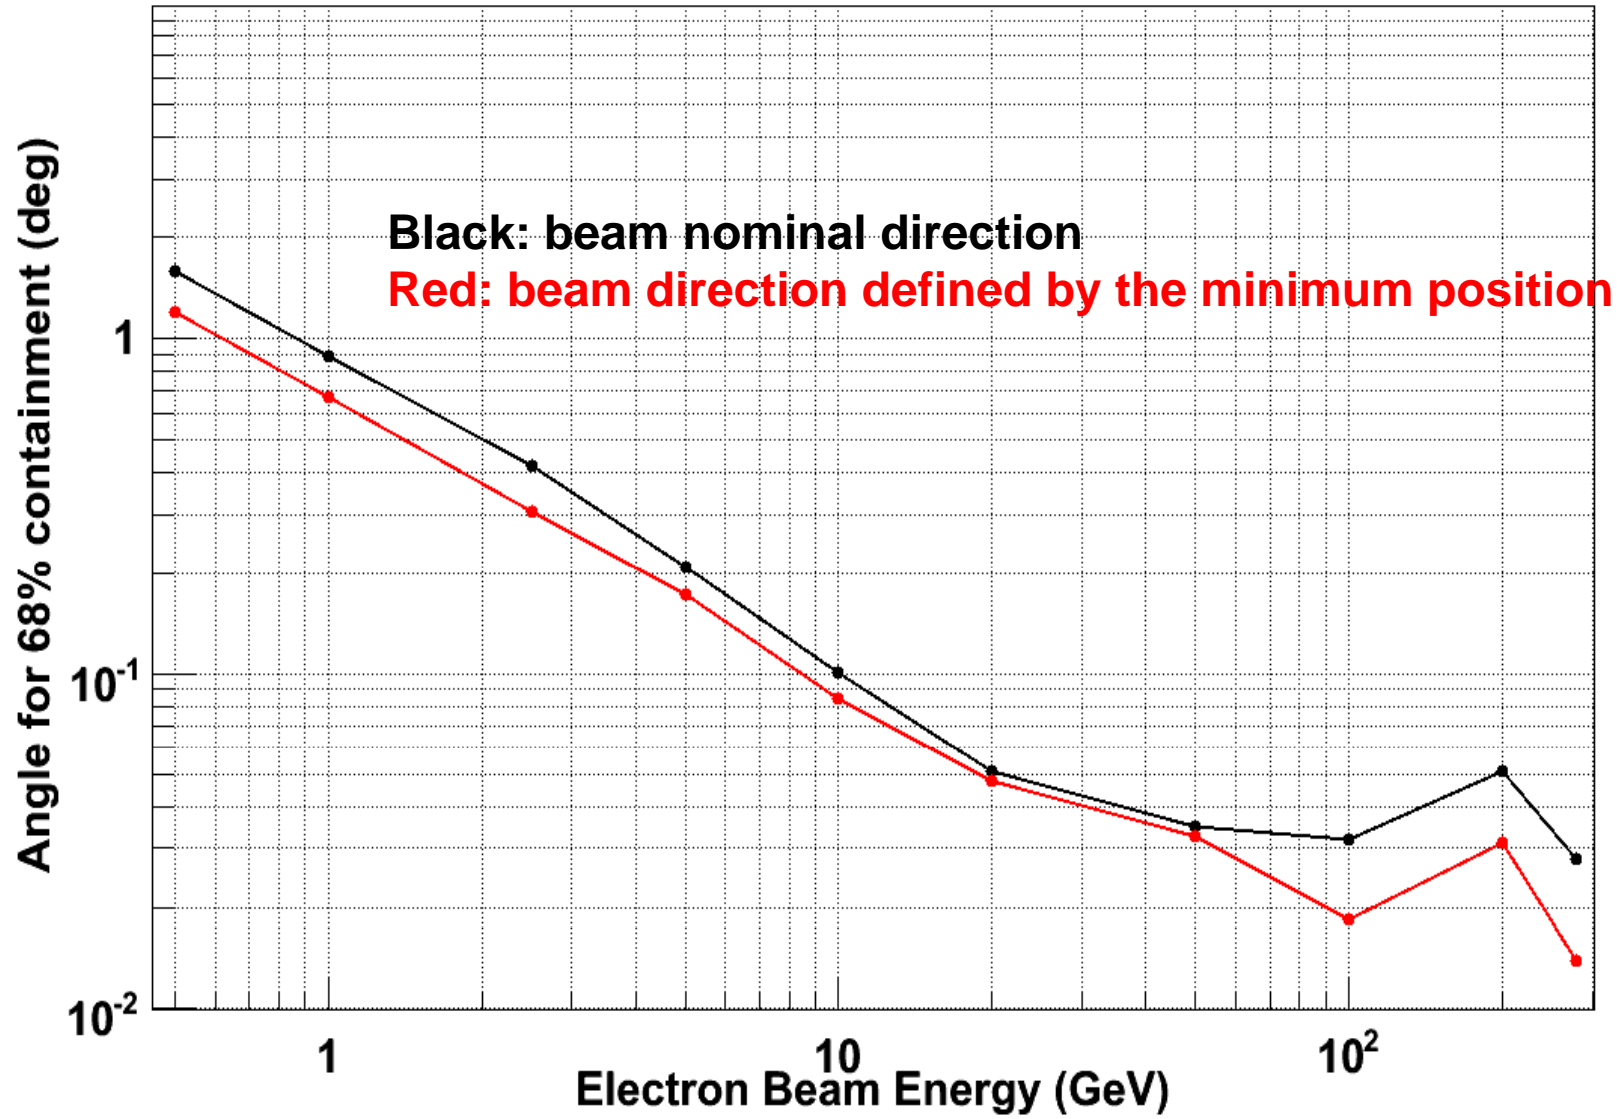

Class A.2.1 PSF (deg) Vs ($\Delta\phi$, $\Delta\theta$)

Class A.2.1 PSF (deg) Vs ($\Delta\phi$, $\Delta\theta$)

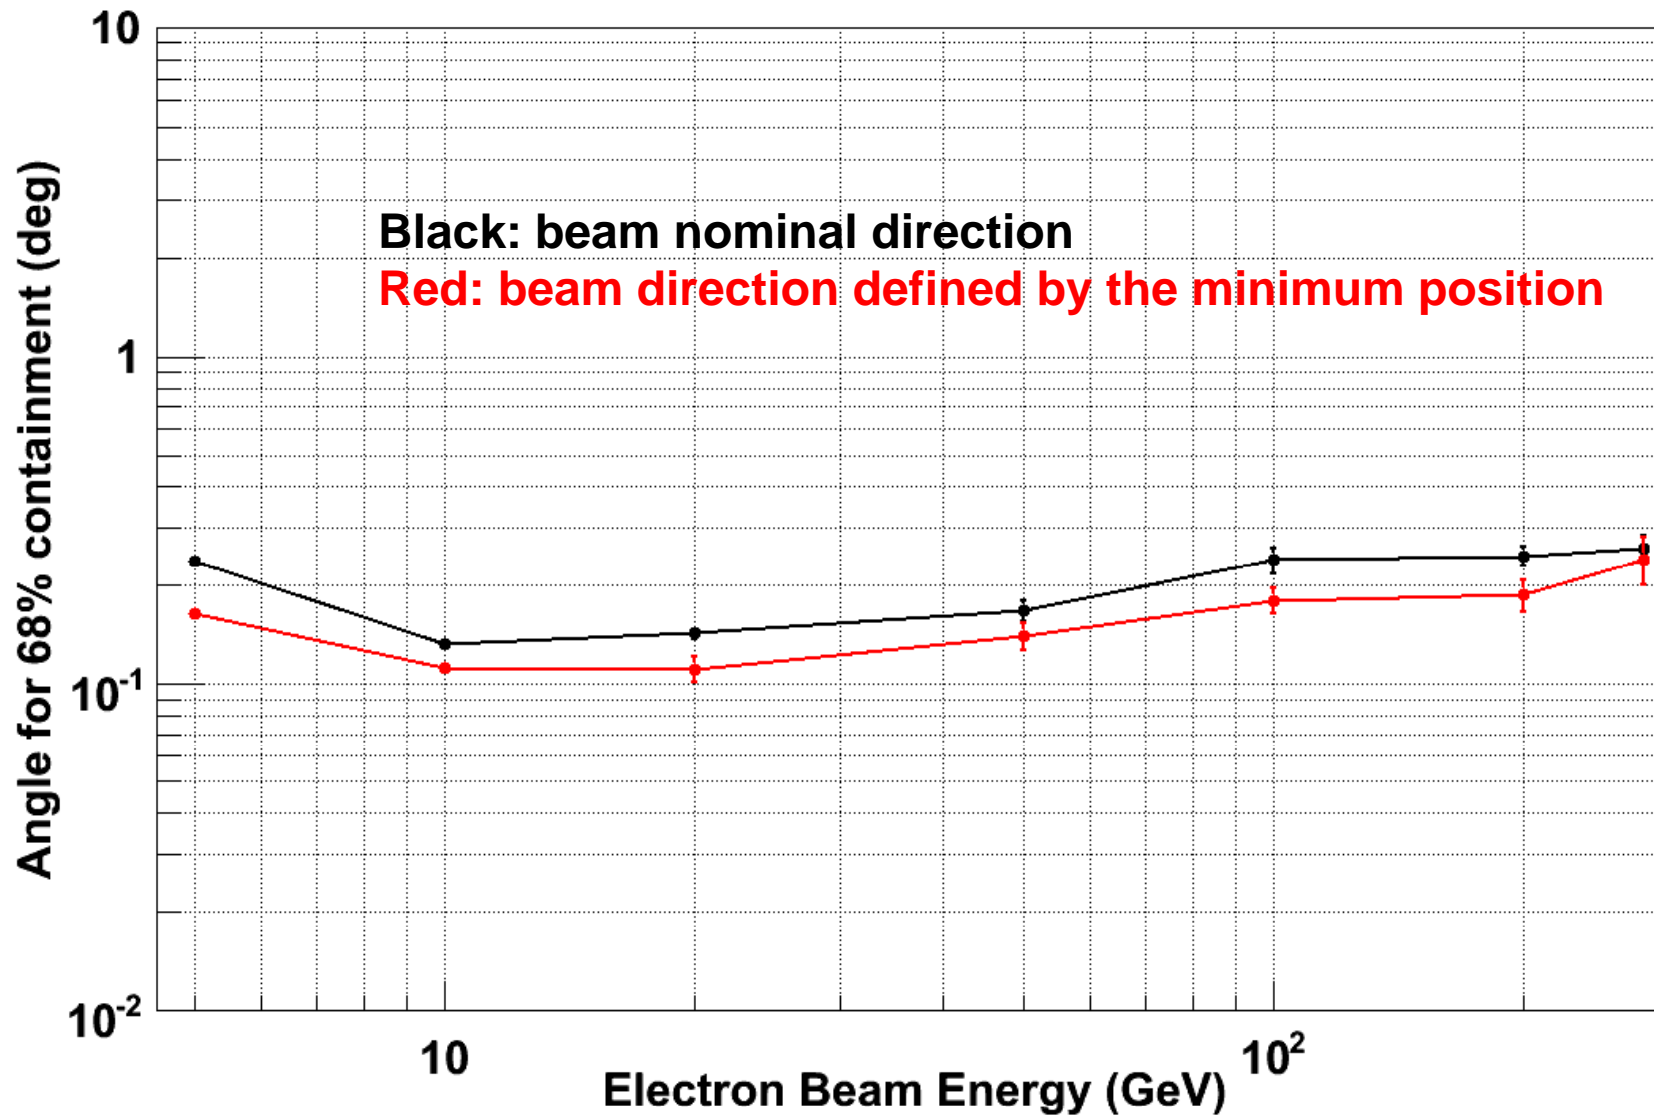

Angle for 68% containment (deg), Beam Incidence Angle = 0 deg

Angle for 68% containment (deg), Beam Incidence Angle = 10 deg

Angle for 68% containment (deg), Beam Incidence Angle = 20 deg

Angle for 68% containment (deg), Beam Incidence Angle = 30 deg
