

SPS Beamtest 2006

Daily Meeting

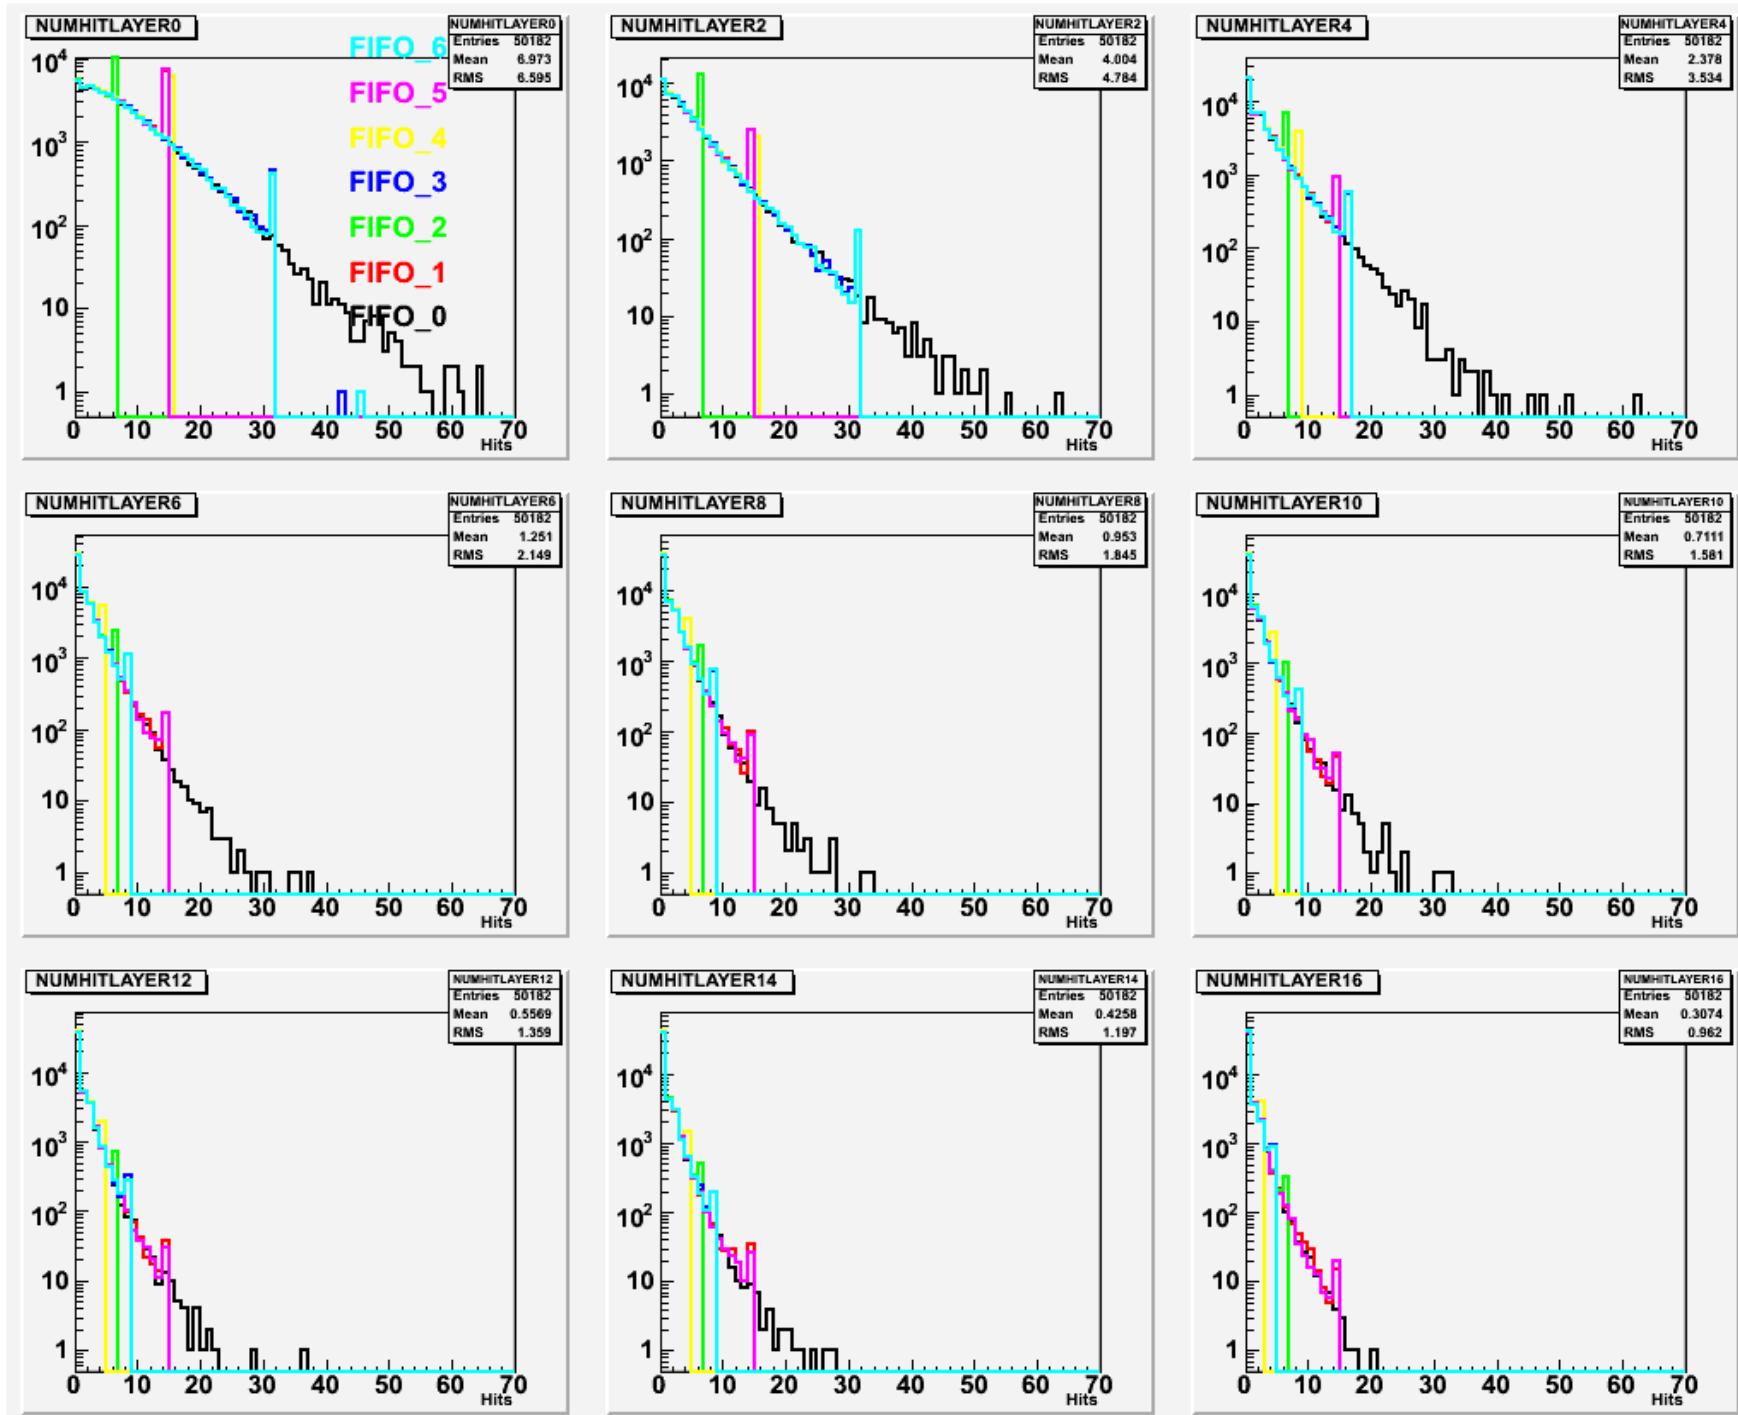

Preliminary study of the different FIFO configurations

FIFO	Almost Full	Max Hit Plane	Schema	Run
0	64	64	CU_BT	700002239
1	64	14	CU_BT_TkrFM8_FIFO_1	700002240
2	64	6	CU_BT_TkrFM8_FIFO_2	700002241
3	64	Tree 1 (high)	CU_BT_TkrFM8_FIFO_3	700002242
4	64	Tree 2 (low)	CU_BT_TkrFM8_FIFO_4	700002243
5	122	14	CU_BT_TkrFM8_FIFO_5	700002244
6	122	Tree 1 (high)	CU_BT_TkrFM8_FIFO_6	700002245

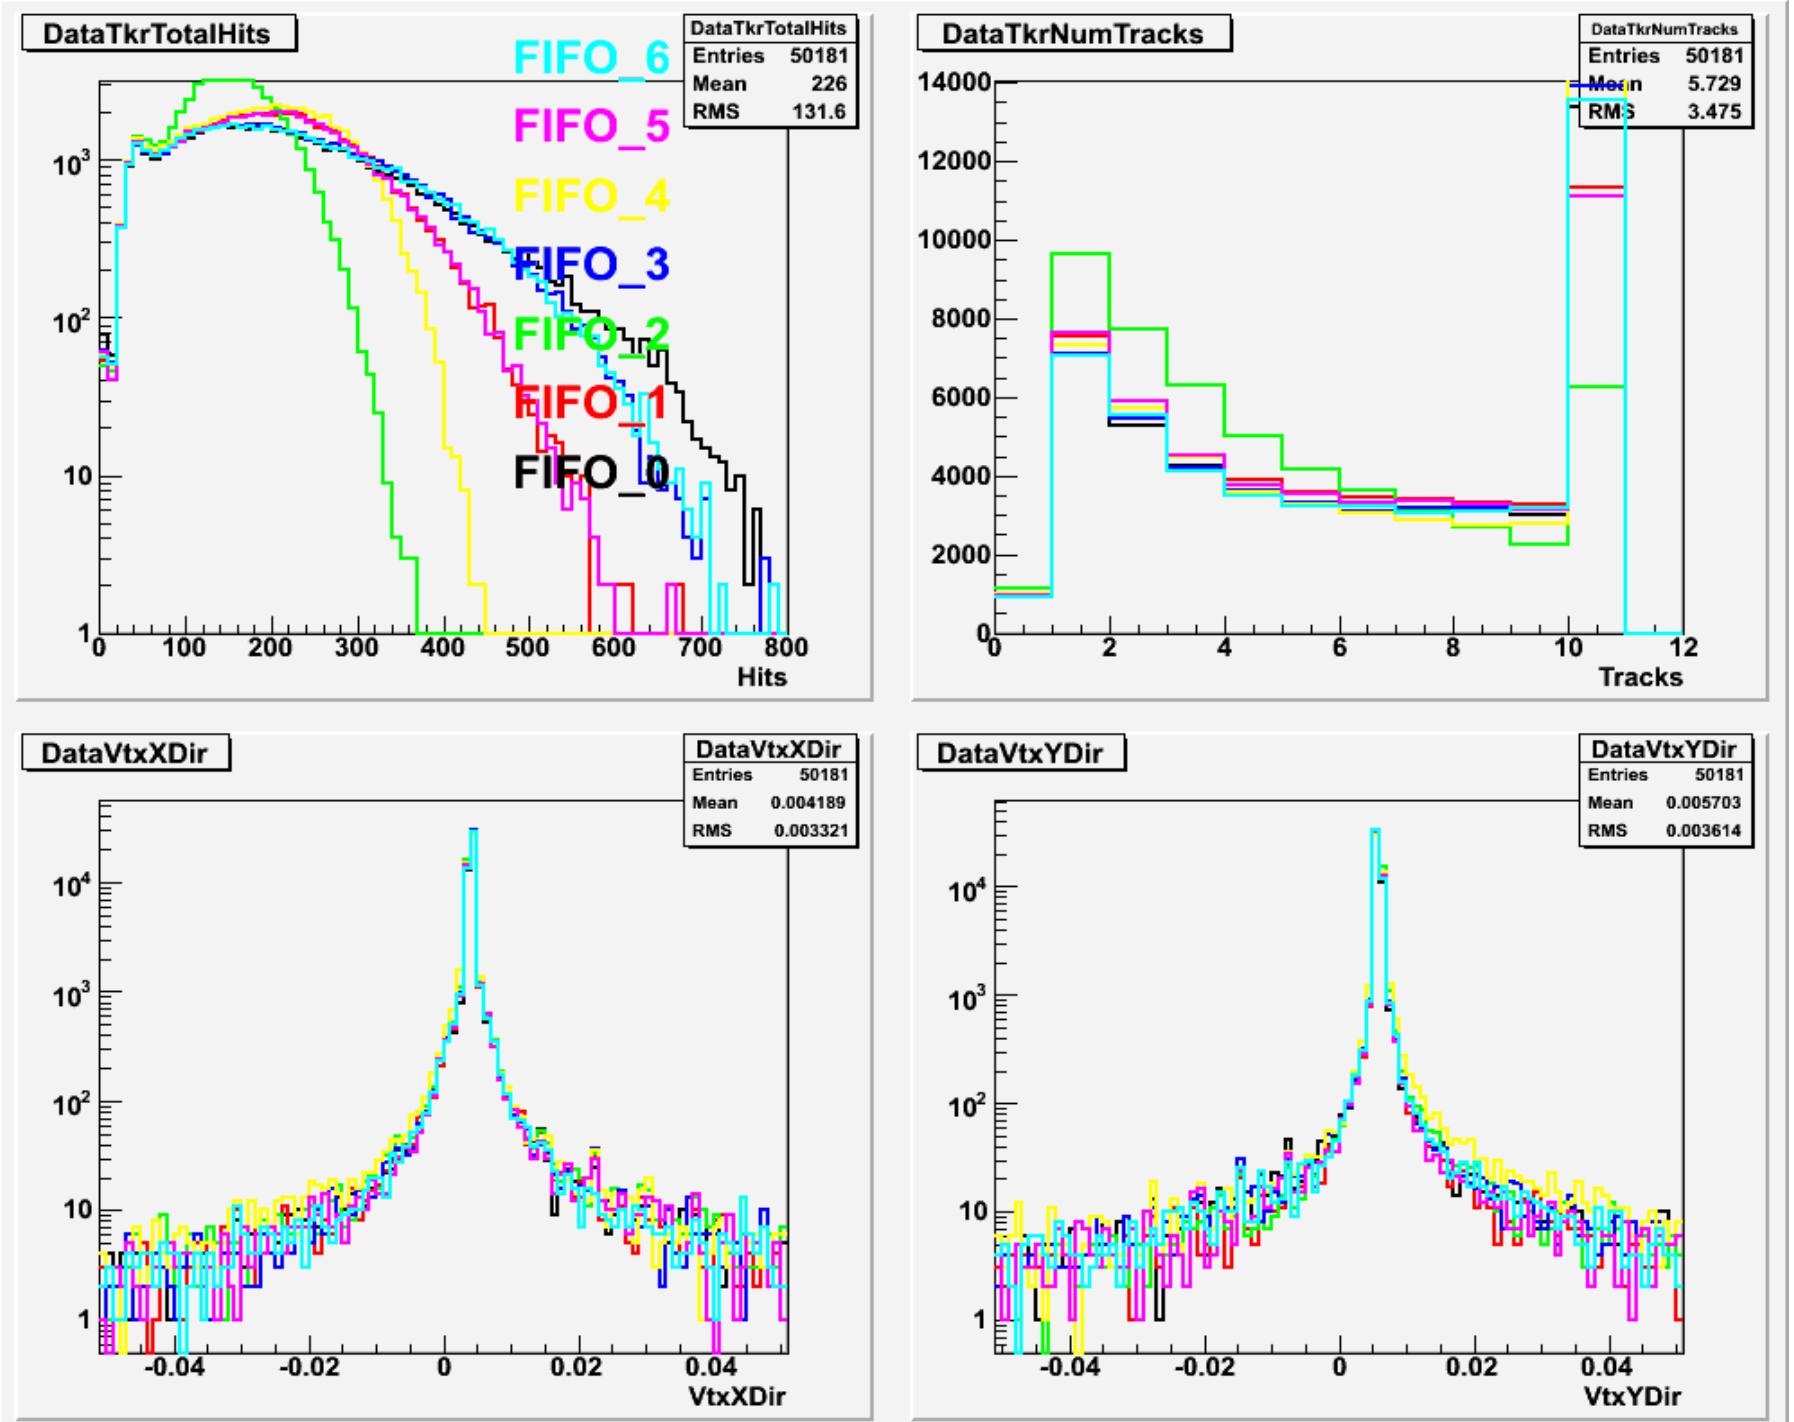

Hits per GTCC

GTCC_2 – Hits per GTRC

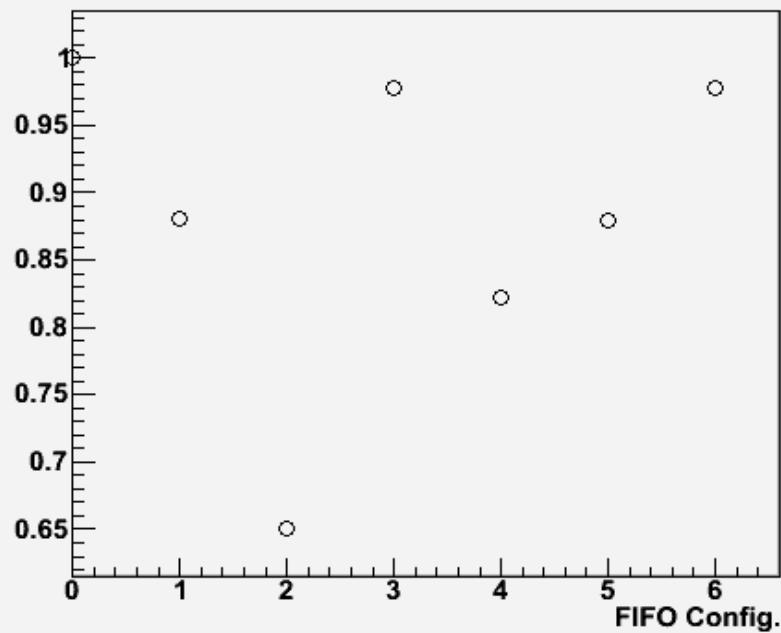

Effect on Tkr global variables

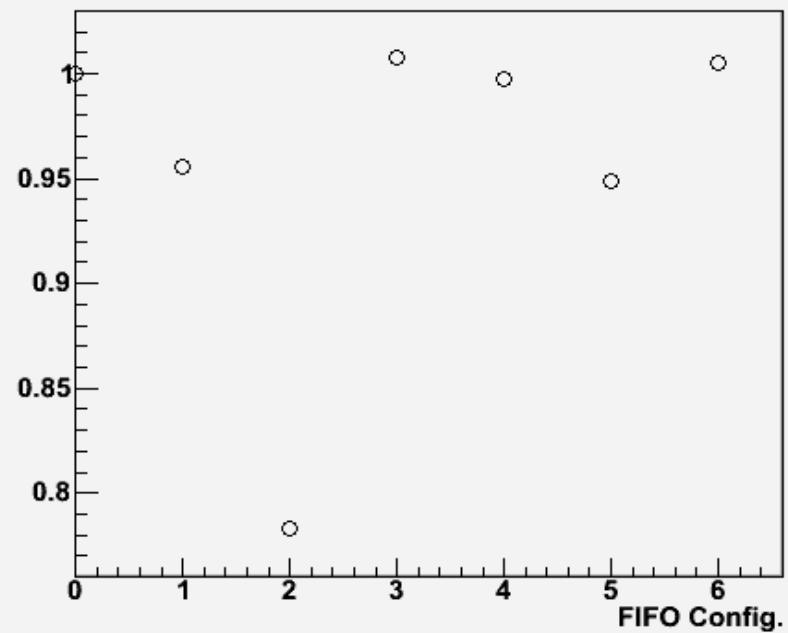

Tkr variables MEAN

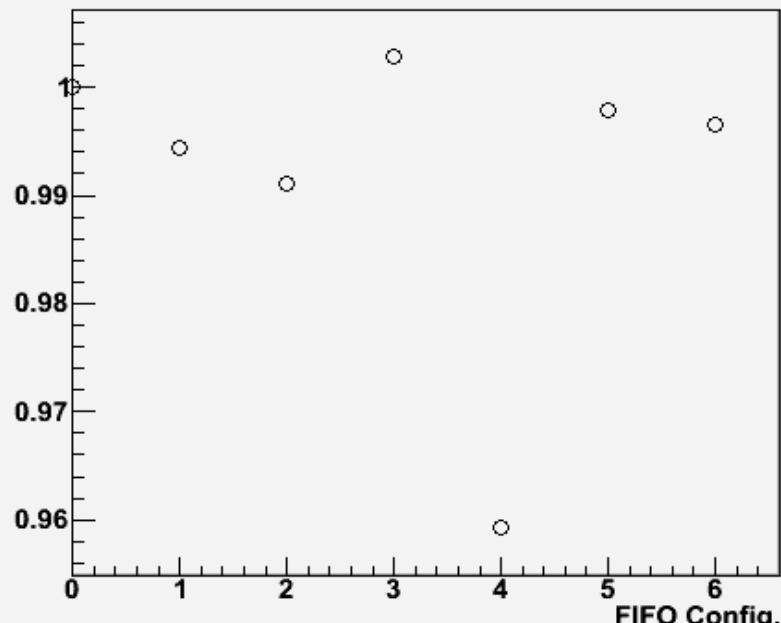

TkrTotalHitsMean : FIFO_i/FIFO_0

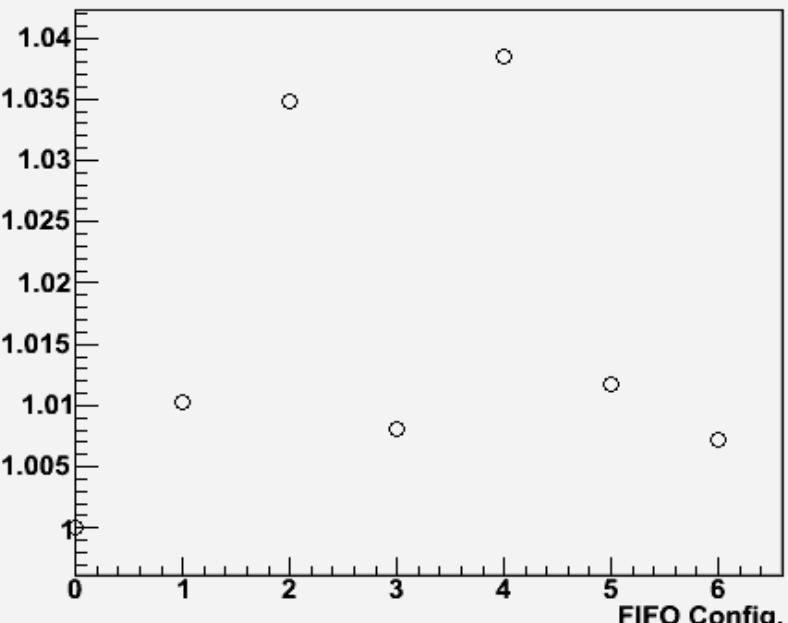

TkrNumTracksMean : FIFO_i/FIFO_0

VtxXdirMean : FIFO_i/FIFO_0

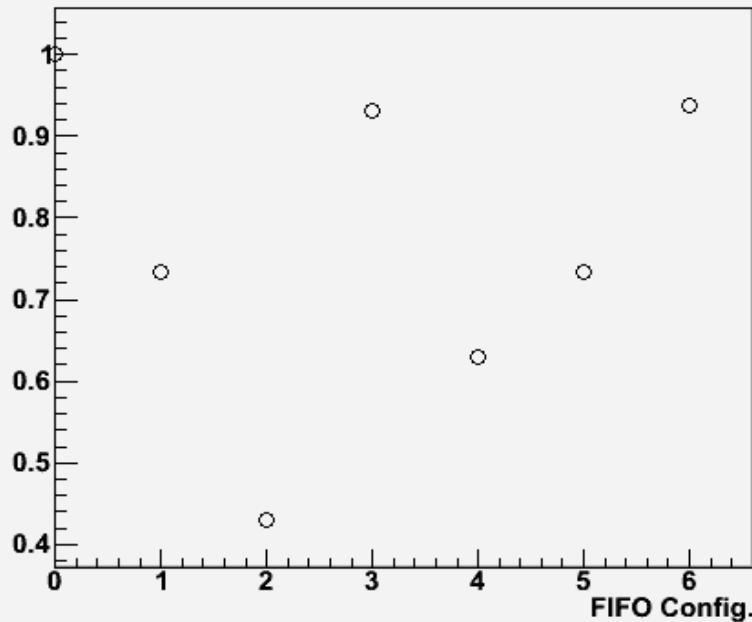

VtxYdirMean : FIFO_i/FIFO_0

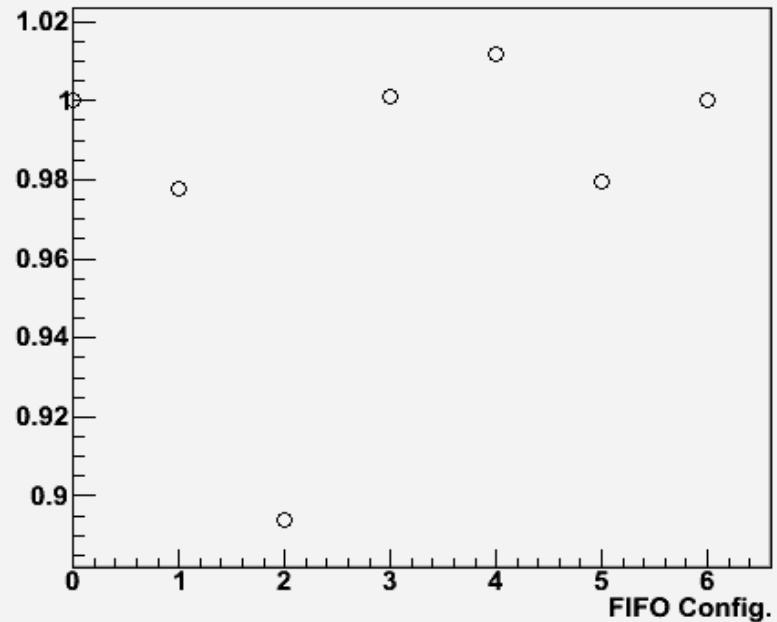

Tkr variables RMS

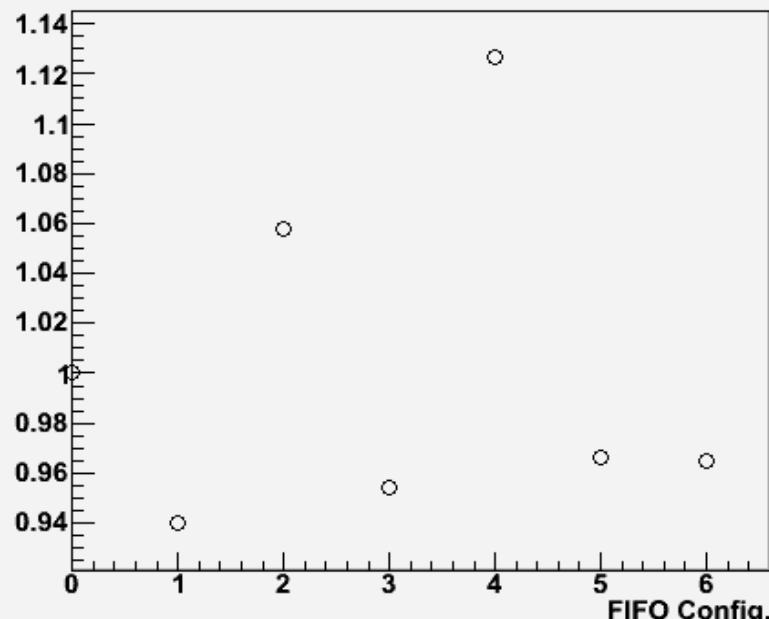

TkrTotalHitsRMS : FIFO_i/FIFO_0

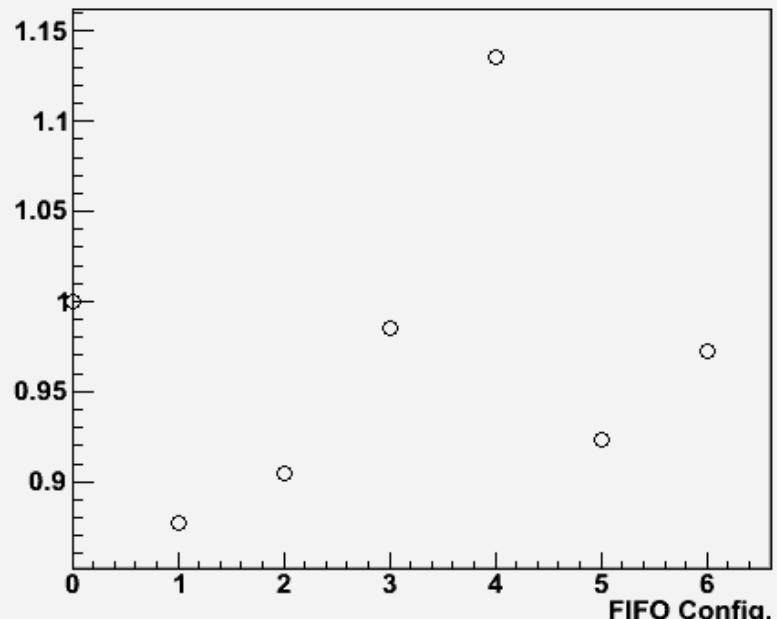

TkrNumTracksRMS : FIFO_i/FIFO_0

VtxXdirRMS : FIFO_i/FIFO_0

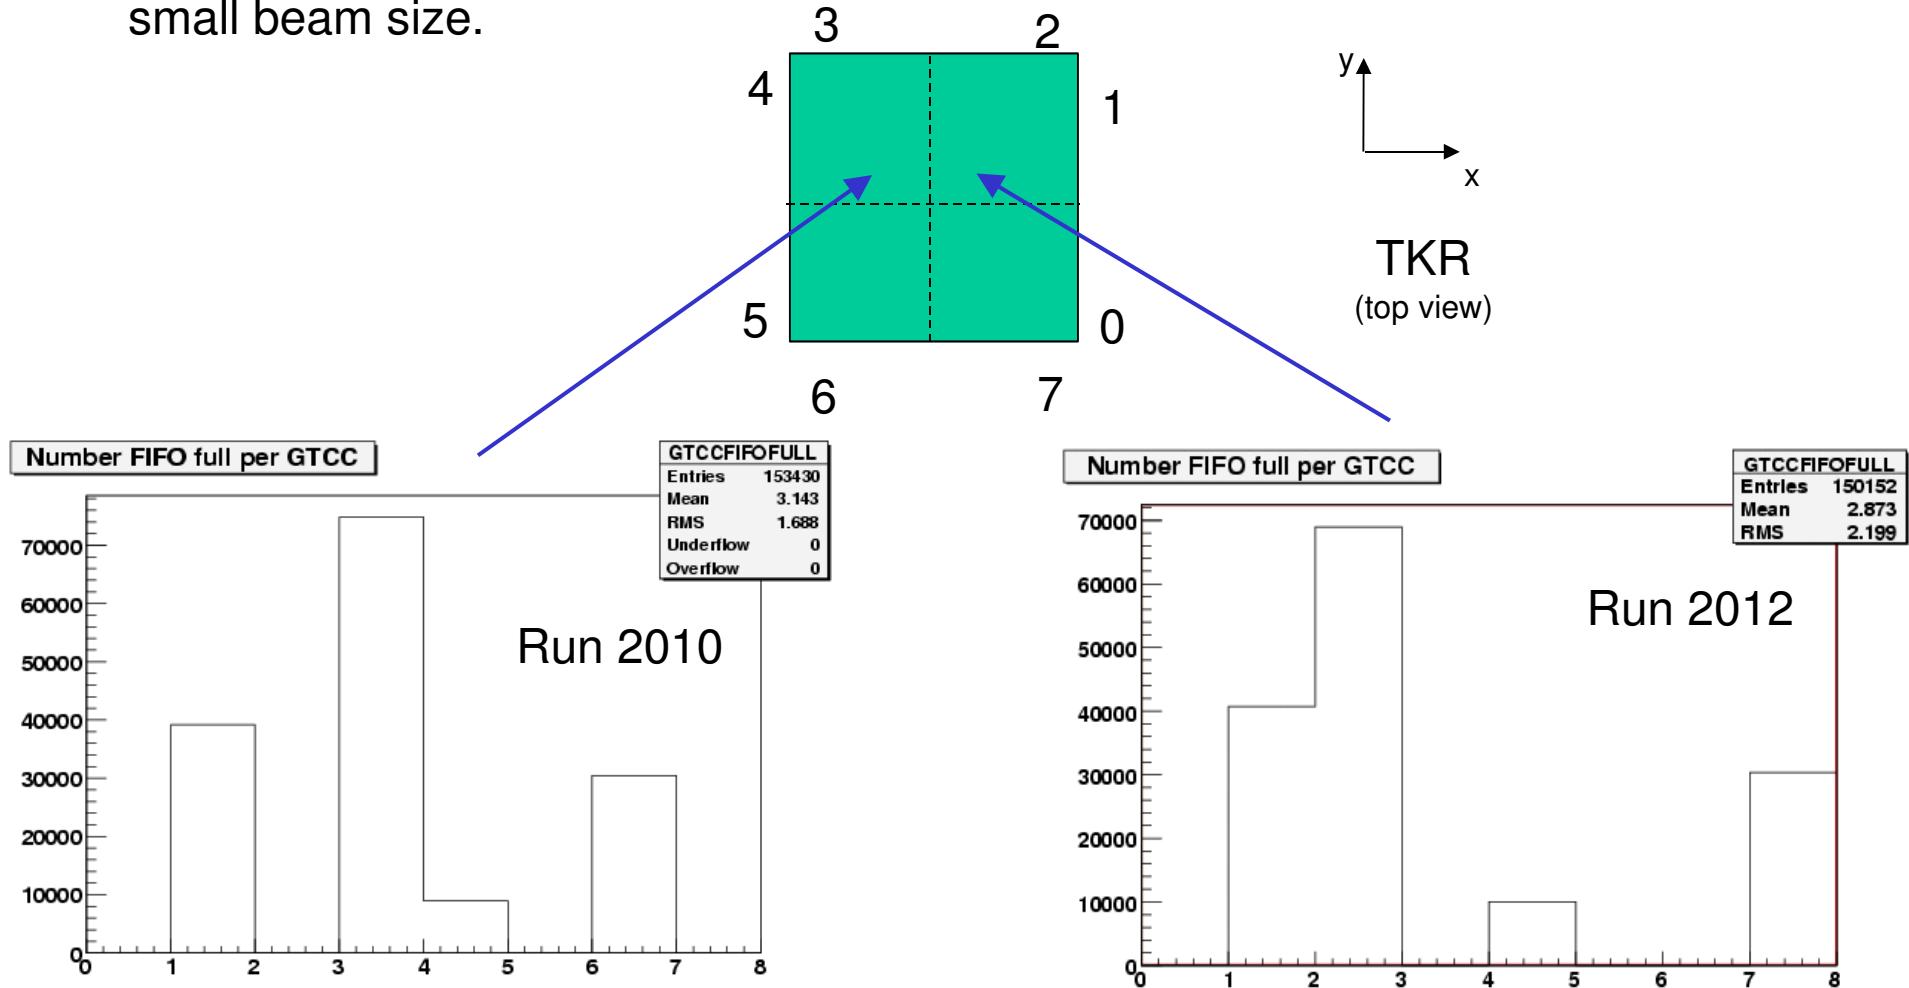

VtxYdirRMS : FIFO_i/FIFO_0

Geometrical consideration

- The fraction of Fifo Full event depend beam impact point and angle.
- At 0° typically only 4 GTCCs have error events → clear consequence of small beam size.

Carmelo's plots

Timing consideration

There are 2 distinct class of events with GTCC Fifo Full error:

- 3) Events with more than 128 hits per GTCC.
- 2) Events too close each other.

The fraction of these events depends on the “almost full” flag on the GTCC registers.

In standard operation at beamtest this flag was set to guaranty 64 hit for the next event and in fact there are **no fifo full evts with less than 64 hit**.

Setting this flag to 122 (runs 2244-2247) eliminate this class of events, but impacts on dead time.
