
LDMX: The Light Dark Matter eXperiment

August 5, 2022

— Matt Solt, University of Virginia —

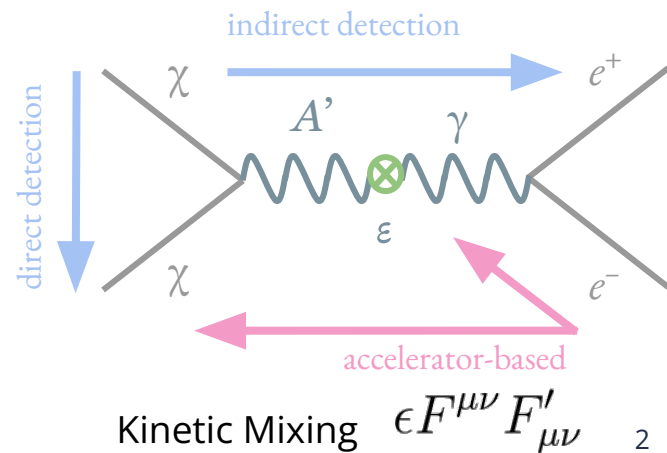

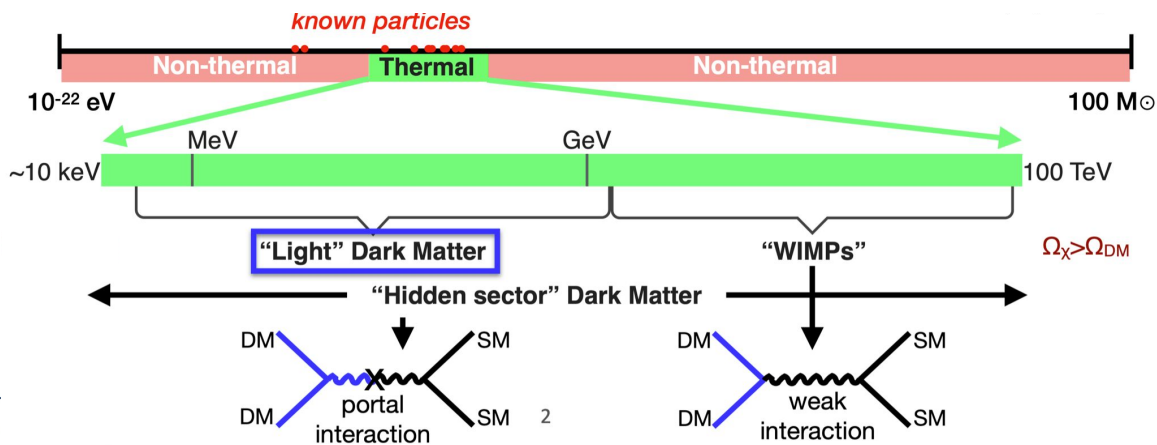

NuFACT 2022

A Thermal Relic & Light Dark Matter

- A thermal relic - simple and predictive model of dark matter (DM)
- Increasing interest in expanding the thermal DM search to “Light” DM in the MeV-GeV mass range
- Simplest prediction includes a dark photon (heavy photon or A') that undergoes kinetic mixing with the SM photon

Dark Photon with a Fixed Target

- Fixed Target Signal Characteristics:
 - Dark bremsstrahlung A' production, invisible decay
 - A' 's take most of the beam energy; only visible final state particle is a soft recoil electron**

- Can probe this mechanism through a missing momentum search. We need...
 - High momentum resolution
 - High veto efficiency of SM backgrounds

LDMX Concept & Design

- Need hermetic detector designed for high rates and high radiation doses
 - **Tagging/recoil tracker:** fast with high momentum resolution and large acceptance
 - **Electromagnetic calorimeter:** fast, good energy resolution, and high granularity
 - **Hadronic calorimeter:** high veto efficiency of neutral hadrons

[Matt Solt on Thursday WG4](#)

Backgrounds

relative rate

All systems combined:
 < 1 background event
 with signal efficiency of
 ~30-50% for O(1e14)
 EoT!

Veto Handles

-  Hard Track
-  Extra Tracks
-  ECal Energy
-  ECal Feature
-  HCal Hits

[arXiv:1912.05535](https://arxiv.org/abs/1912.05535)

LDMX Sensitivity

Phase 1: 4 GeV,

10^{14} electrons

Phase 2: 8 GeV,

10^{16} electrons

[arXiv:1808.05219](https://arxiv.org/abs/1808.05219)

Planned at SLAC to run
parasitically to LCLS-II

$$2m_{DM} < m_{A'}$$

Proposed LDMX baseline schedule

LDMX Electro-nuclear Scattering Measurements

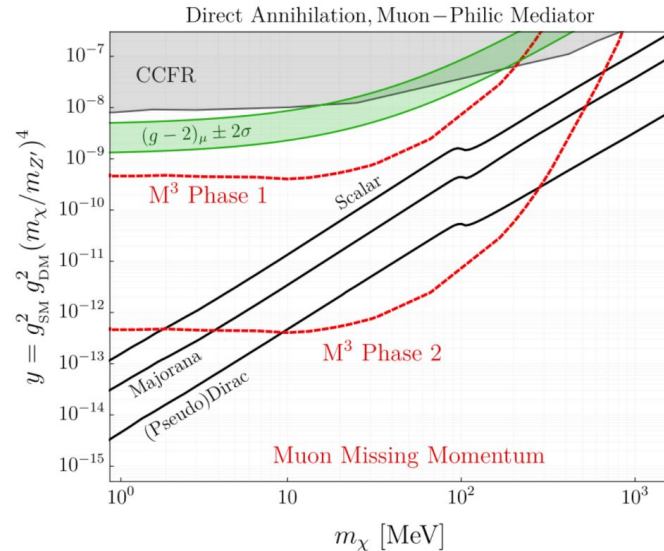

- Small angle acceptance and individual particle reconstruction (initial and final states) allows for electro-nuclear measurements of interest to neutrino experiments (such as DUNE)

Wes Ketchum on
Tuesday WG2

Muon Missing Momentum Experiment (M^3)

- Proposed missing momentum search for muon-philic invisibly decaying particles- scalars (S) and vectors (V)
- Utilizes LDMX-like detector with a thick active target and 15 GeV muon beam (Fermilab)

Phase I = $1e10$ MOT:
 $g-2$ anomaly
 Phase 2 = $1e13$ MOT:
dark matter
