

Long term variability in blazars

J. H. E. Thiersen
Supervisor: Prof M. Böttcher

Fermi Summer School
5 June 2017

- Blazars exhibit rapid varying emissions.
- Extensive effort in multiwavelength observations.
- Most research focuses on individual flares.
- Continuous observations in i.e. X-ray and Fermi γ -ray frequencies presents the opportunity to study the long term variability.

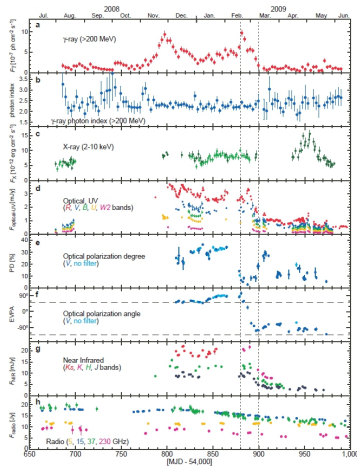

Figure : Fermi-LAT Collaboration & 3C 279 multi-band campaign (2010)

- Inferring the causes of variability from modelling of power spectral densities (PSD) from long term light curves.
- Testing leptonic and lepto-hadronic models which are currently used to explain blazar emissions.
- Construct parameter variation patterns from given PSD's.
- Study resulting multiwavelength light curves, PSD's and cross correlations.
