

Planning for the LCLS-2 System: Data System Design and Benchmarks

July 25th 2017

Data Benchmarking Workshop

Amedeo Perazzo

LCLS Controls & Data Systems Division Director

LCLS science case

Guiding principles for the buildout of the LCLS-II data system

Benchmarks and projections

Design

LCLS Science Case

Science Requirement: Data Analytics for high repetition rate Free Electron Lasers

SLAC

FEL data challenge:

- **Ultrafast X-ray pulses** from LCLS are used like flashes from a high-speed strobe light, producing stop-action movies of atoms and molecules
- Both **data processing** and **scientific interpretation** demand intensive computational analysis

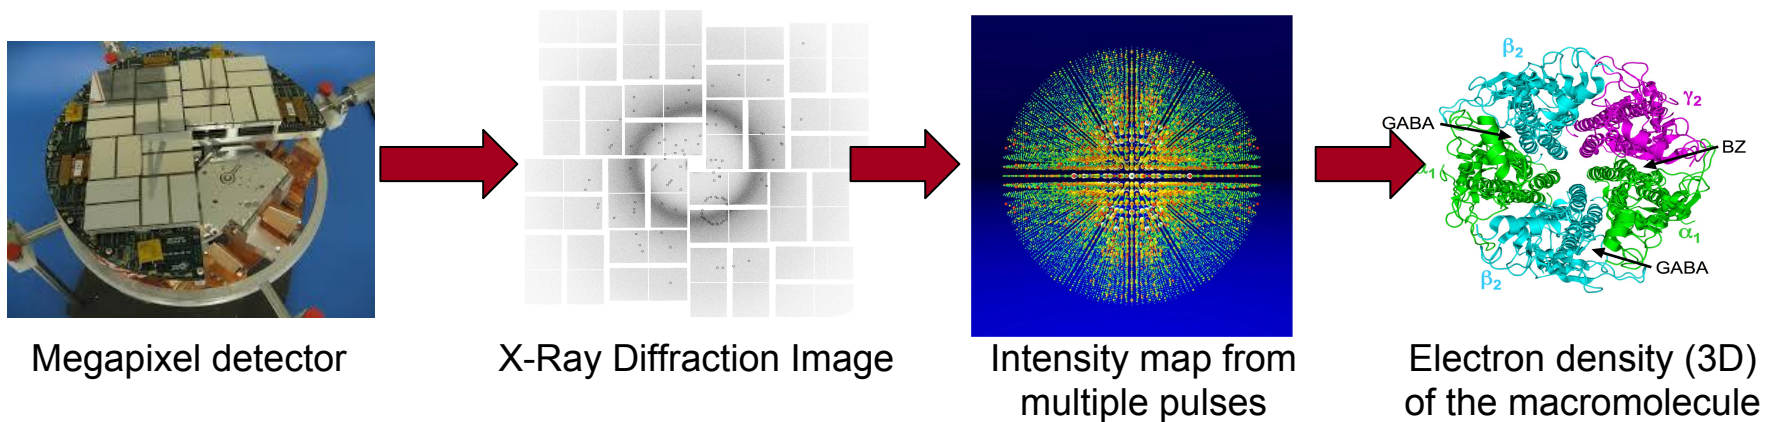

LCLS-II will increase **data throughput by three orders of magnitude** by 2025, creating an exceptional scientific computing challenge

LCLS-II represents SLAC's largest data challenge by far

Example of LCLS Data Analytics: The Nanocrystallography Pipeline

Serial Femtosecond Crystallography (SFX, or nanocrystallography): huge benefits to the study of **biological macromolecules**, including the availability of femtosecond time resolution and the avoidance of radiation damage under physiological conditions (“**diffraction-before-destruction**”)

Well understood computing requirements

Significant fraction of LCLS experiments (~90%) use large area imaging detectors

Easy to scale: processing needs are linear with the number of frames

Must extrapolate from 120Hz (today) to 5-10 kHz (2022) to >50 kHz (2026)

Guiding Principles

Guiding Principles and Priorities

Key aspects LCLS-II data system:

1. **Fast feedback**
2. **24/7 availability**
3. **Short burst**
4. **Storage**
5. **Throughput**
6. Speed and flexibility of **development cycle** is critical

Hardware design guiding principles

Performance

Reliability

Ease of use

Software design guiding principles

Flexibility

User friendliness

Performance

When conflicts arise go back to the top guiding principle

Make full use of national capabilities

LCLS-II will require access to High End Computing Facilities (NERSC and LCF) for highest demand experiments (exascale)

MIRA
at Argonne

TITAN
at Oak Ridge

CORI
at NERSC

Photon Science Speedway

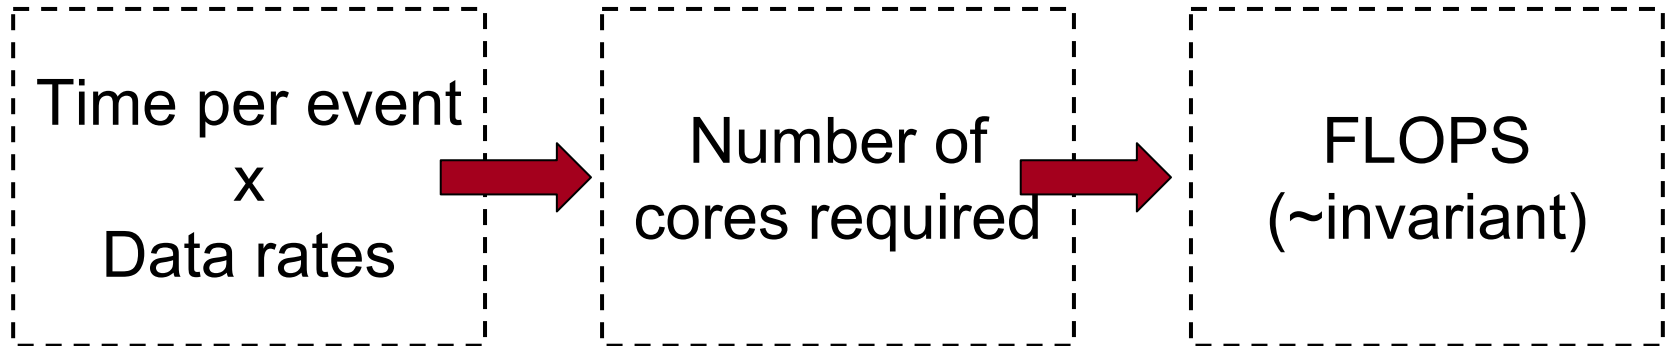

Stream science data files on-the-fly from the LCLS beamlines to the NERSC supercomputers via ESnet

Very positive partnership to date, informing our future strategy

Benchmarks and projections

Note on how processing needs are calculated

Distribution of Indexing Time for 80 Events

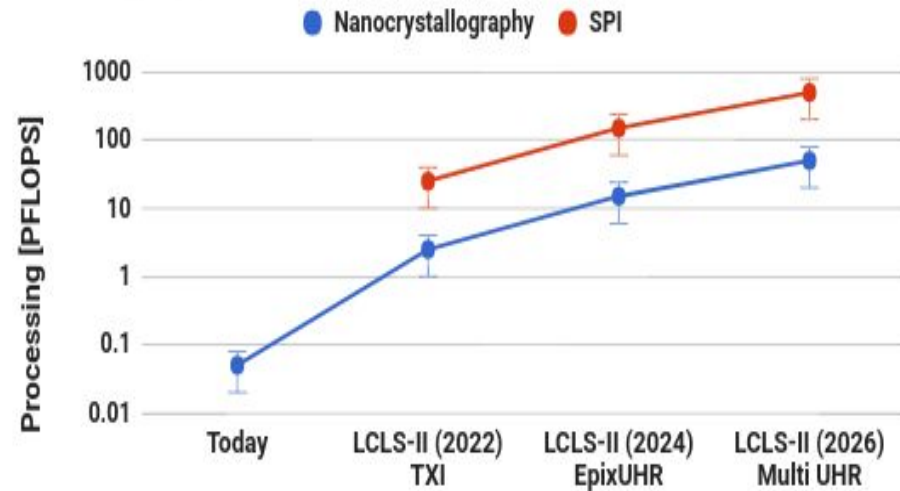

Example: indexing time per event for nanocrystallography

Scale of the LCLS-II Data Challenge: Throughput and Processing Projections

Peak Throughput (prior to data reduction)

Processing Projections

Example data rate for LCLS-II (early science)

- 1 x 4 Mpixel detector @ 5 kHz = **40 GB/s**
- 100K points fast digitizers @ 100kHz = **20 GB/s**
- Distributed diagnostics 1-10 GB/s range

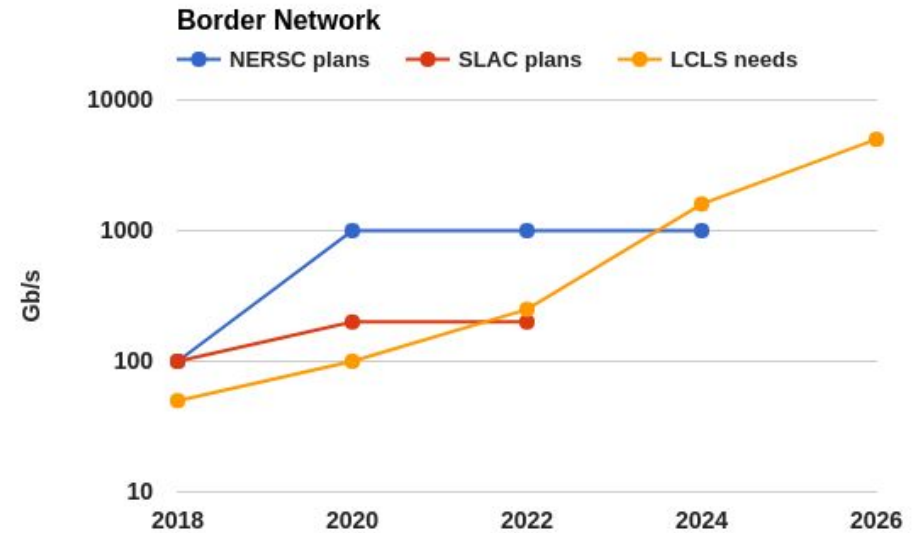

Example LCLS-II and LCLS-II-HE (mature facility)

- 2 planes x 4 Mpixel ePixUHR @ 100 kHz = **1.6 TB/s**

More sophisticated algorithms currently under development (e.g., for single particle imaging) will require exascale machines

Throughput requirements are extremely challenging: data reduction needed

Projected Networking and Storage Requirements for SLAC will soon be dominated by LCLS

LCLS-II will dominate SLAC storage requirements by 2022-2024

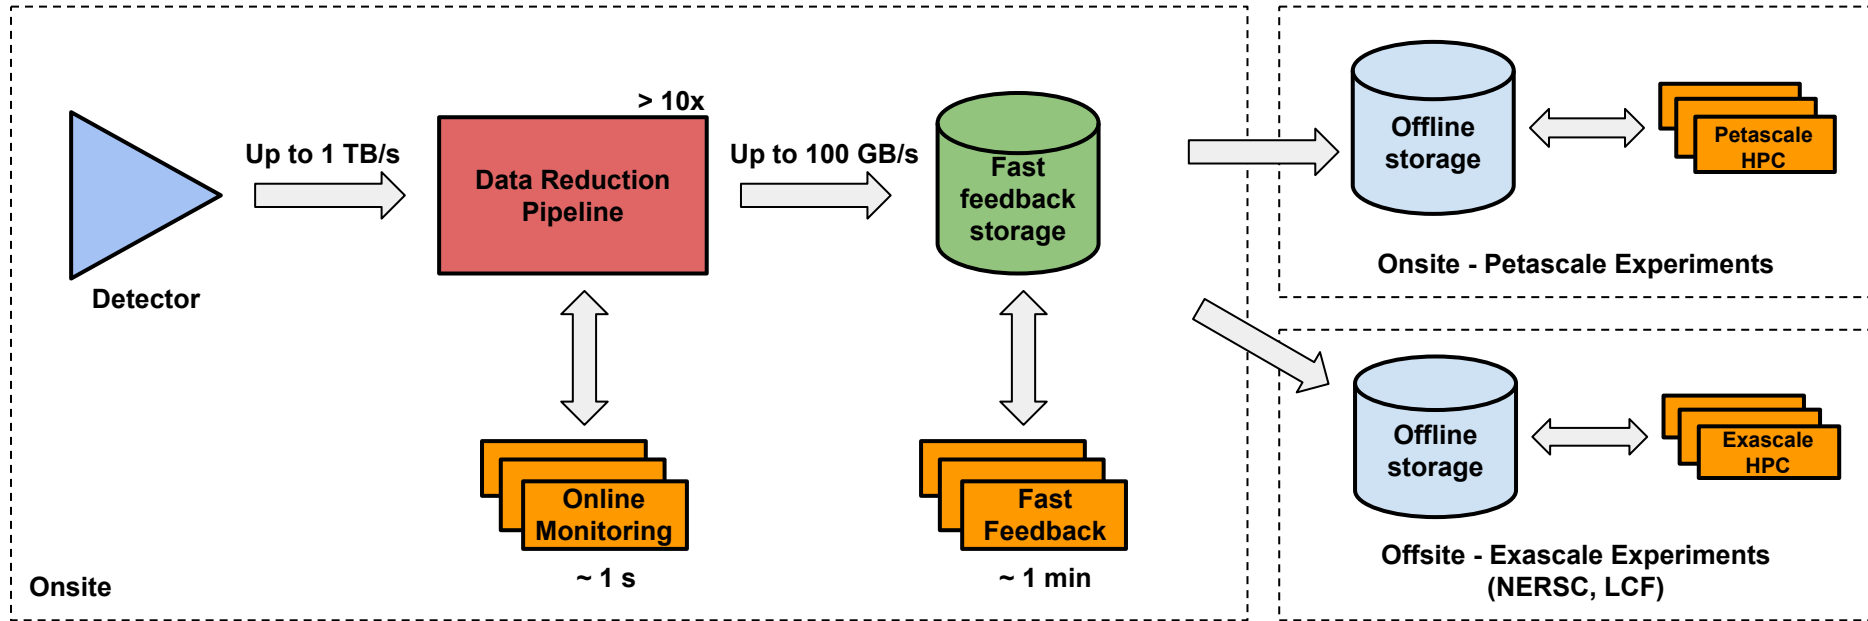

We need to find new networking solutions with ESnet beyond 2024

This assumes 10x data reduction is achieved

Design

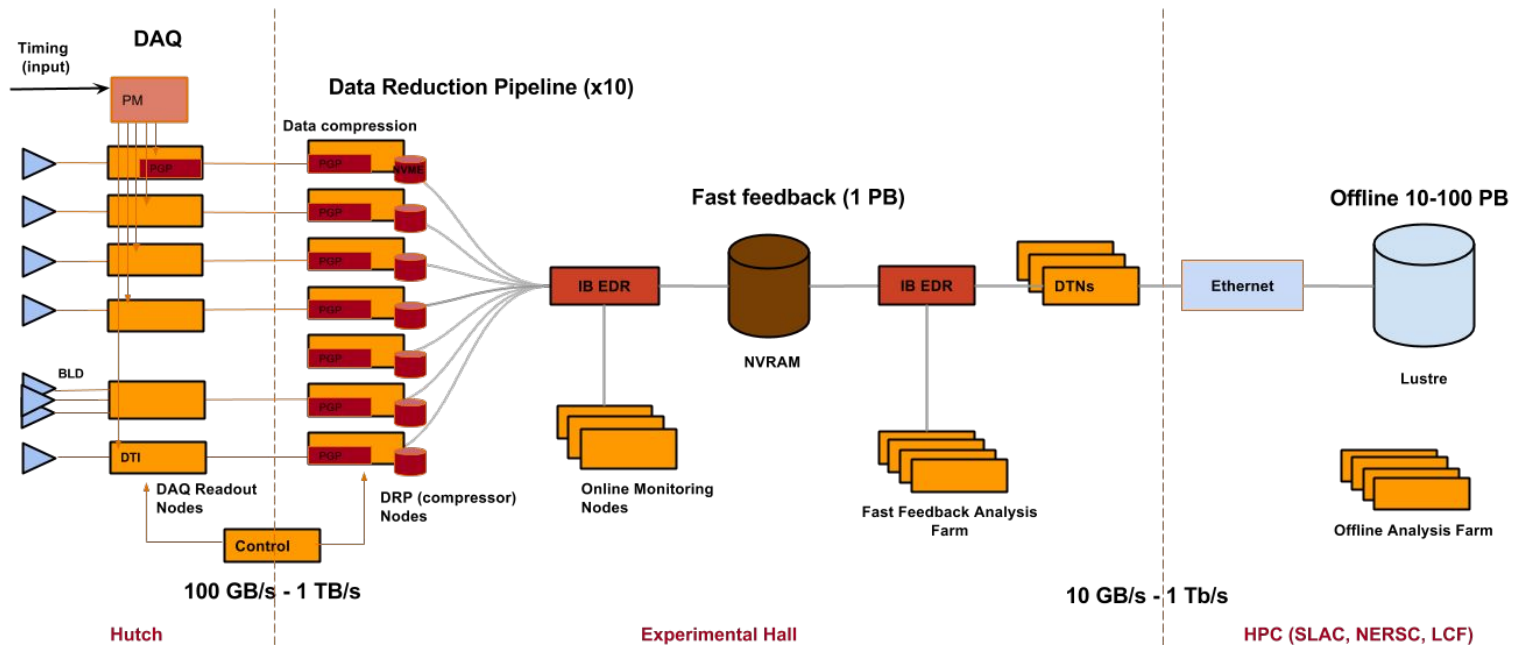

LCLS-II Data Flow

Data Reduction Pipeline

- Besides cost, there are **significant risks** by not adopting on-the-fly data reduction
 - Inability to move the data to HEC, system complexity (robustness, intermittent failures)
- Developing toolbox of techniques (**compression, feature extraction, vetoing**) to run on a **Data Reduction Pipeline**
- Significant **R&D effort**, both engineering (throughput, heterogeneous architectures) and scientific (real time analysis)

Without on-the-fly data reduction we would face unsustainable hardware costs by 2026

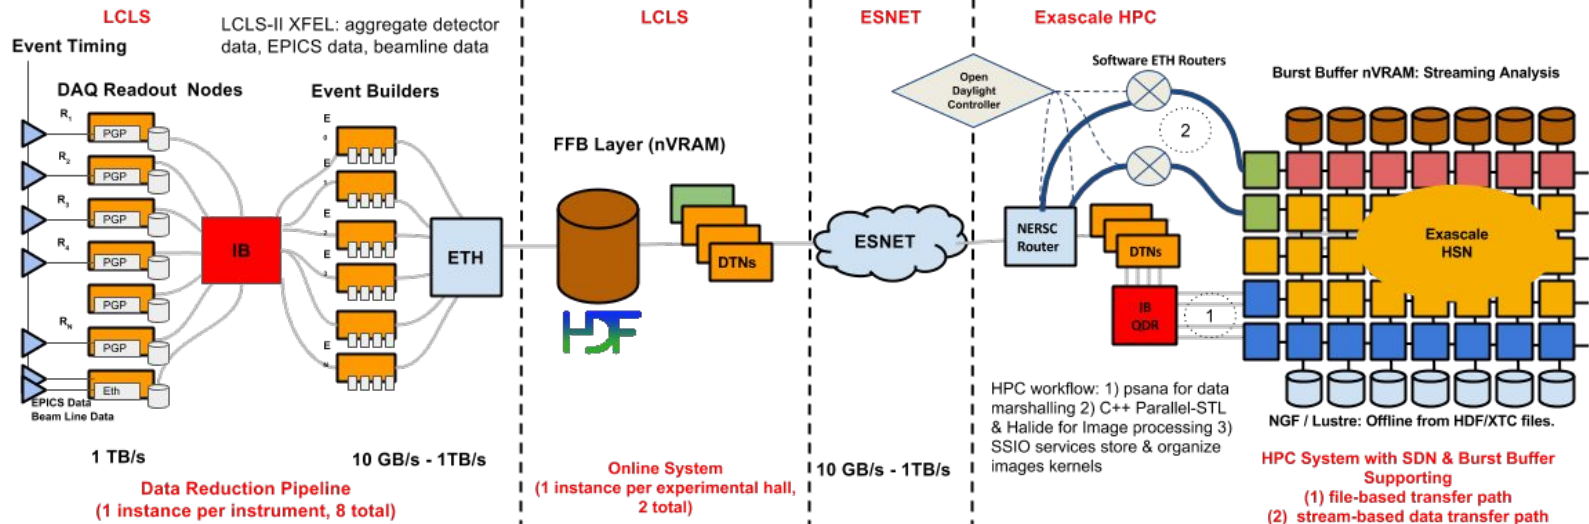

ExaFEL:

Data Analytics at the Exascale for Free Electron Lasers

\$10M Application Project within Exascale Computing Project (DOE/ASCR)

High data throughput experiments	LCLS data analysis framework	Infrastructure
Algorithmic improvements and ray tracing - Example test-cases of Serial Femtosecond Crystallography, and Single Particle Imaging	Porting LCLS code to supercomputer architecture, allow scaling from hundreds of cores (now) to hundred of thousands of cores	Data flow from SLAC to NERSC over ESnet

We need to build from this very important early engagement with ASCR

DOE High End Computing (HEC) Facilities will play a critical role, complemented by dedicated, local systems

LCLS-II will require:

- Access to **HEC Facilities**
 - For highest demand experiments (exascale)
- **Dedicated, local** capabilities
 - **Data Reduction Pipeline**: Data compression, feature extraction, real time analysis
 - **Science Data Facility**: Storage and analysis for standard experiments

Operational necessity for local & dedicated capabilities:

- **Real time** (< 1s) analysis
- **Data reduction** (before sending to HEC over ESnet)
- **Unacceptable use of HEC** (immediate burst jobs)
- Coordinated **outages** between HEC and experimental facilities not viable if HEC required for all experiments
