

Loading fixtures

- Matt has put together the loading fixture.
- The vacuum is quite weak with such small holes, can nudge the glass slides quite easily.
- The dowel pins Stuart ordered are too short (see picture) so that by the time you're making contact with the pins it's already very close to the chips/base plate.
- It's also not clear how we set this up:
 - Do we do the fixed height? Release them under their own weight? Maurice warned that in the past a fixed height couldn't compensate for all the variation.
 - If we want to bring them in and gradually lower them, do we do it all at once? How?
- Some pics:
