

# The Search for a Dark Photon at JLab

**Tim Nelson - SLAC**

on behalf of the HPS collaboration

MIT Lunch Seminar - October 26, 2010

# “Dark Photon?”

## Standard Model

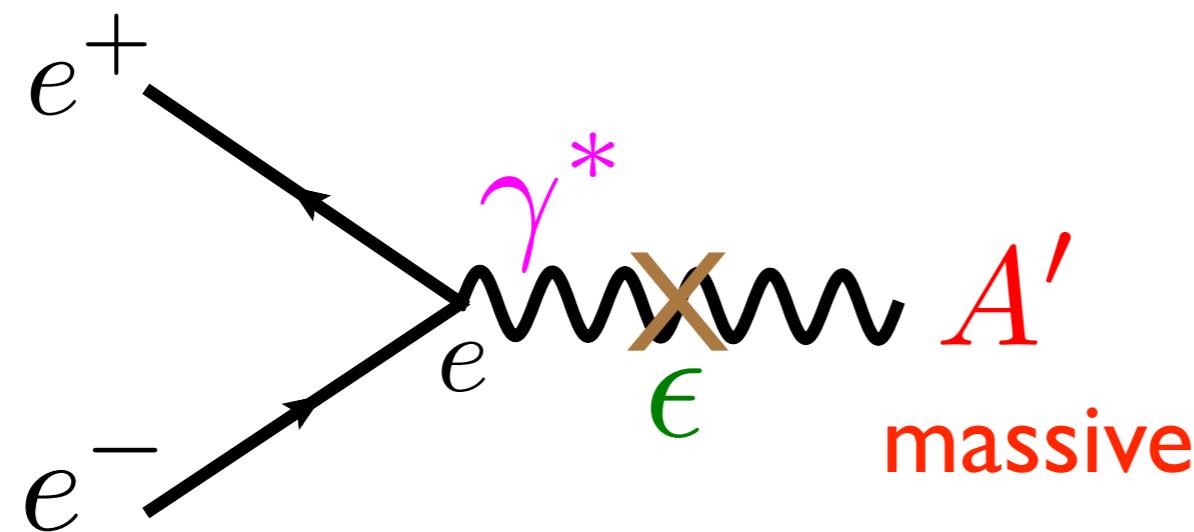

strong      weak      electromagnetic

$g$        $W^\pm, Z$        $\gamma$

## Hidden Sector?

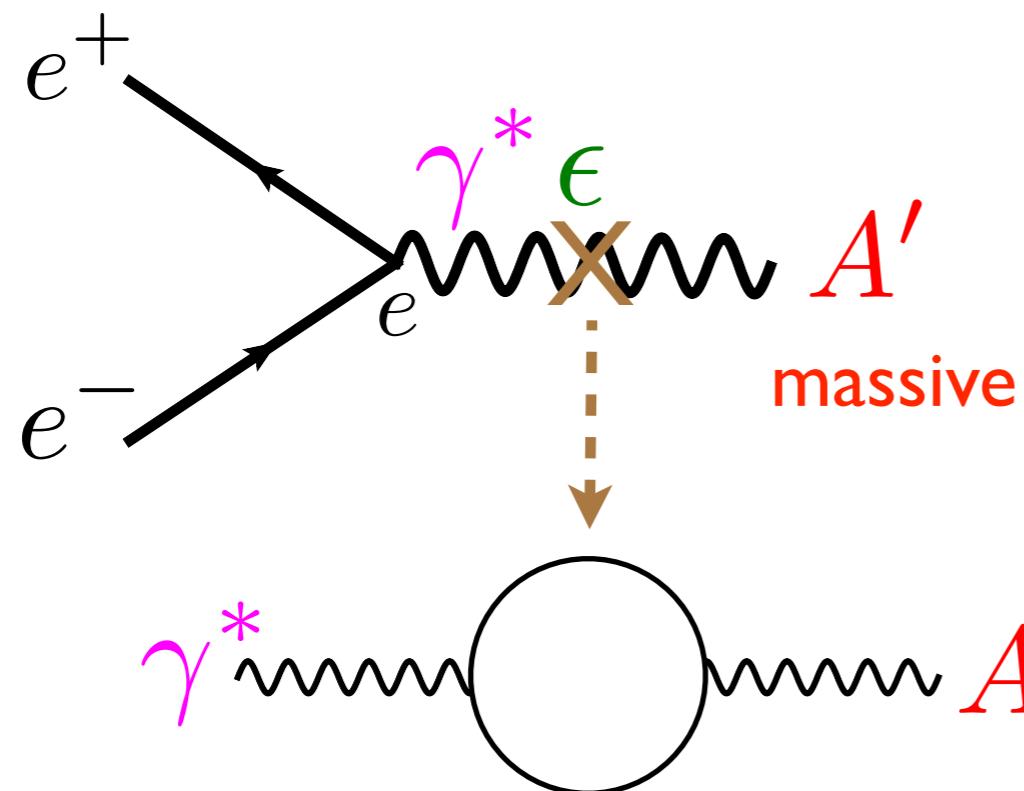

new force?  
 $A'$

Photon can mix with a new vector boson  $A'$

Hidden Sector  
 $U(1)$

# How Does it Work?

$$\epsilon = \sqrt{\frac{\alpha'}{\alpha}}$$

$$\Delta\mathcal{L} = \frac{\epsilon}{2} F^{Y,\mu\nu} F'_{\mu\nu}$$

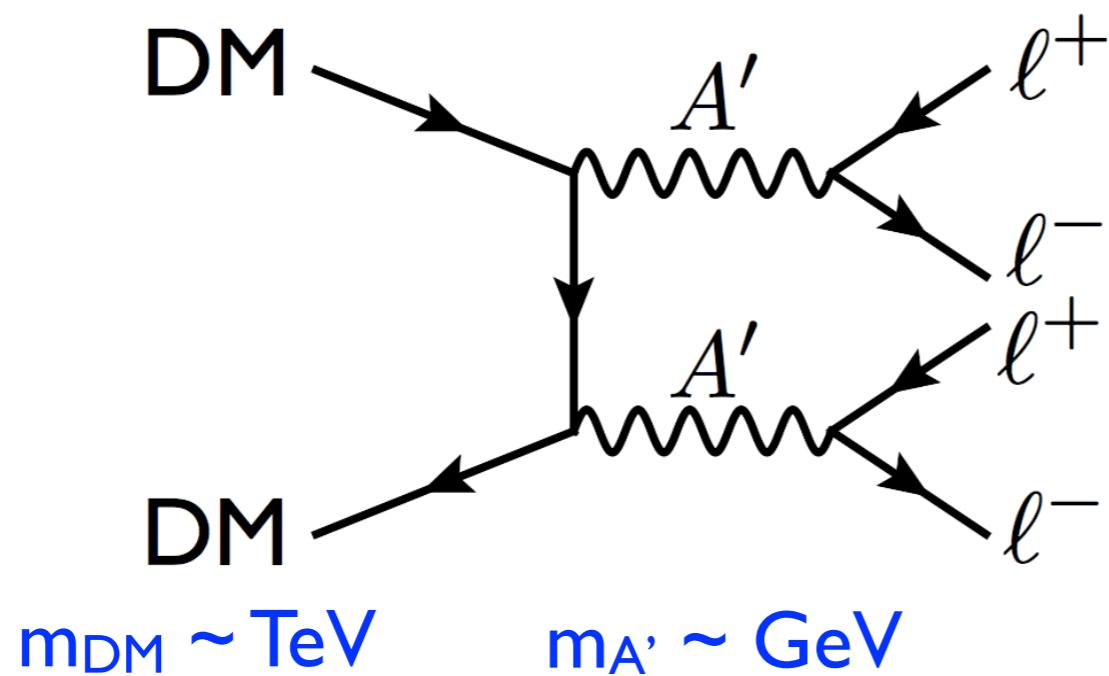

“Kinetic Mixing” generated by heavy particles  
interacting with  $\gamma$  and  $A'$

[Holdom - 1986]

quarks & charged leptons have  $e \cdot \epsilon$  coupling to  $A'$

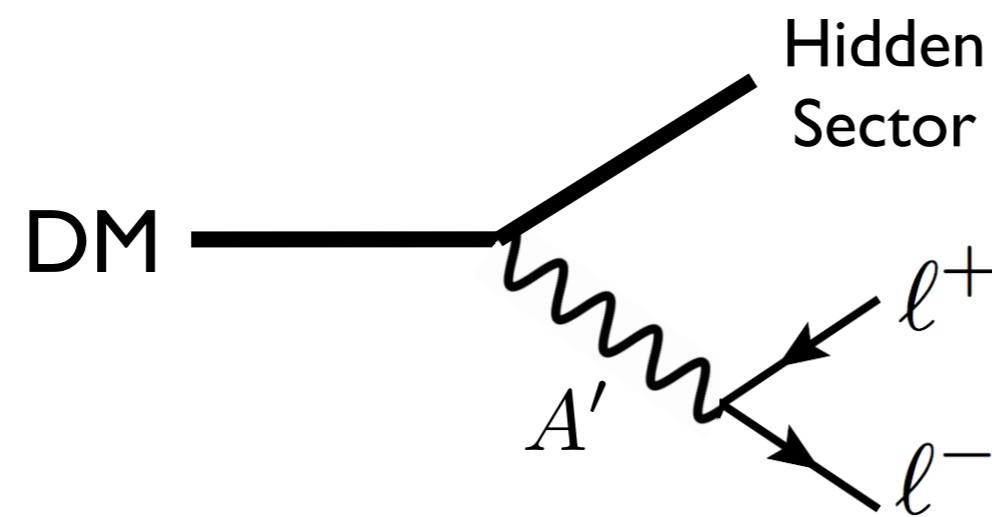

# What Makes It Interesting?

What if dark matter  
annihilates to  $A'$  ??

Arkani-Hamed, Finkbeiner, Slatyer, Weiner  
Pospelov & Ritz

What if dark matter  
decays to  $A'$  ??

[Ruderman, Volansky]

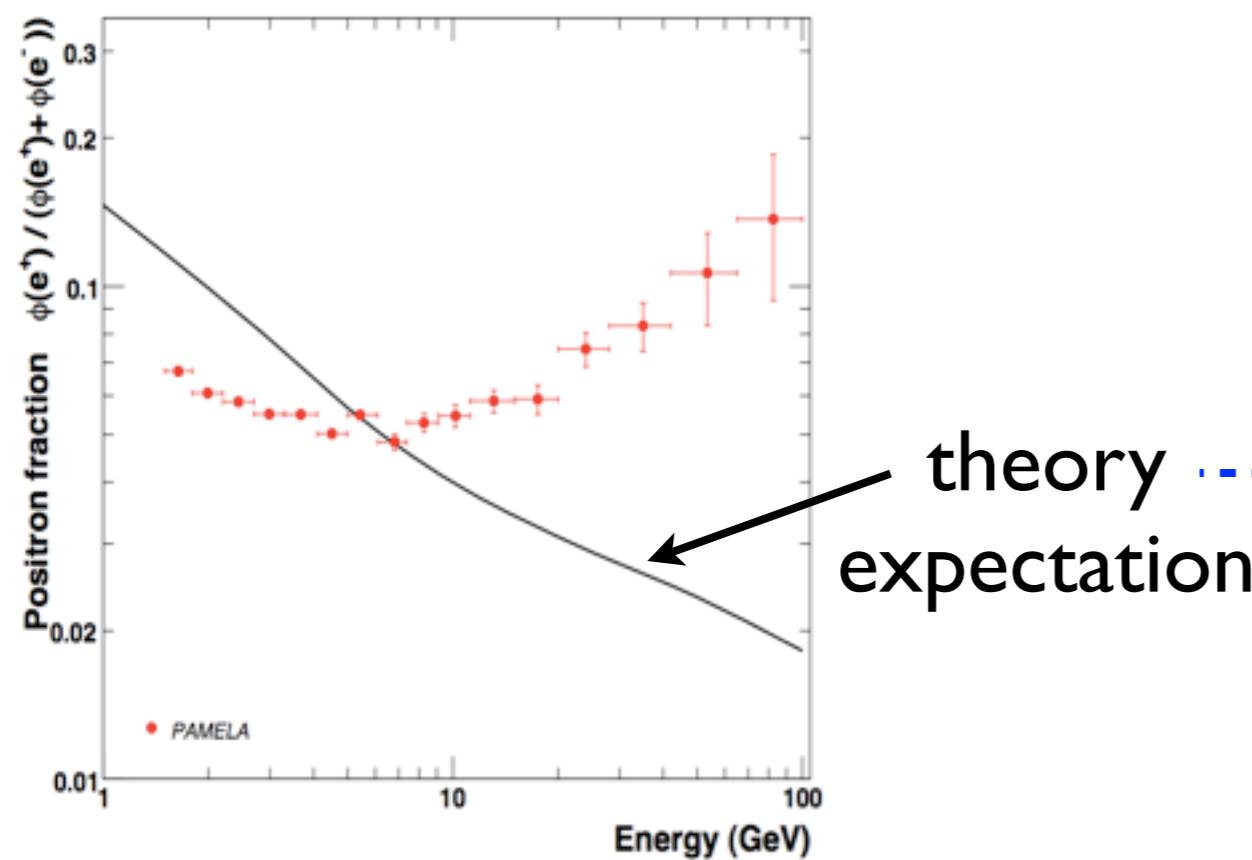

[Essig, Kaplan, Schuster, Toro]

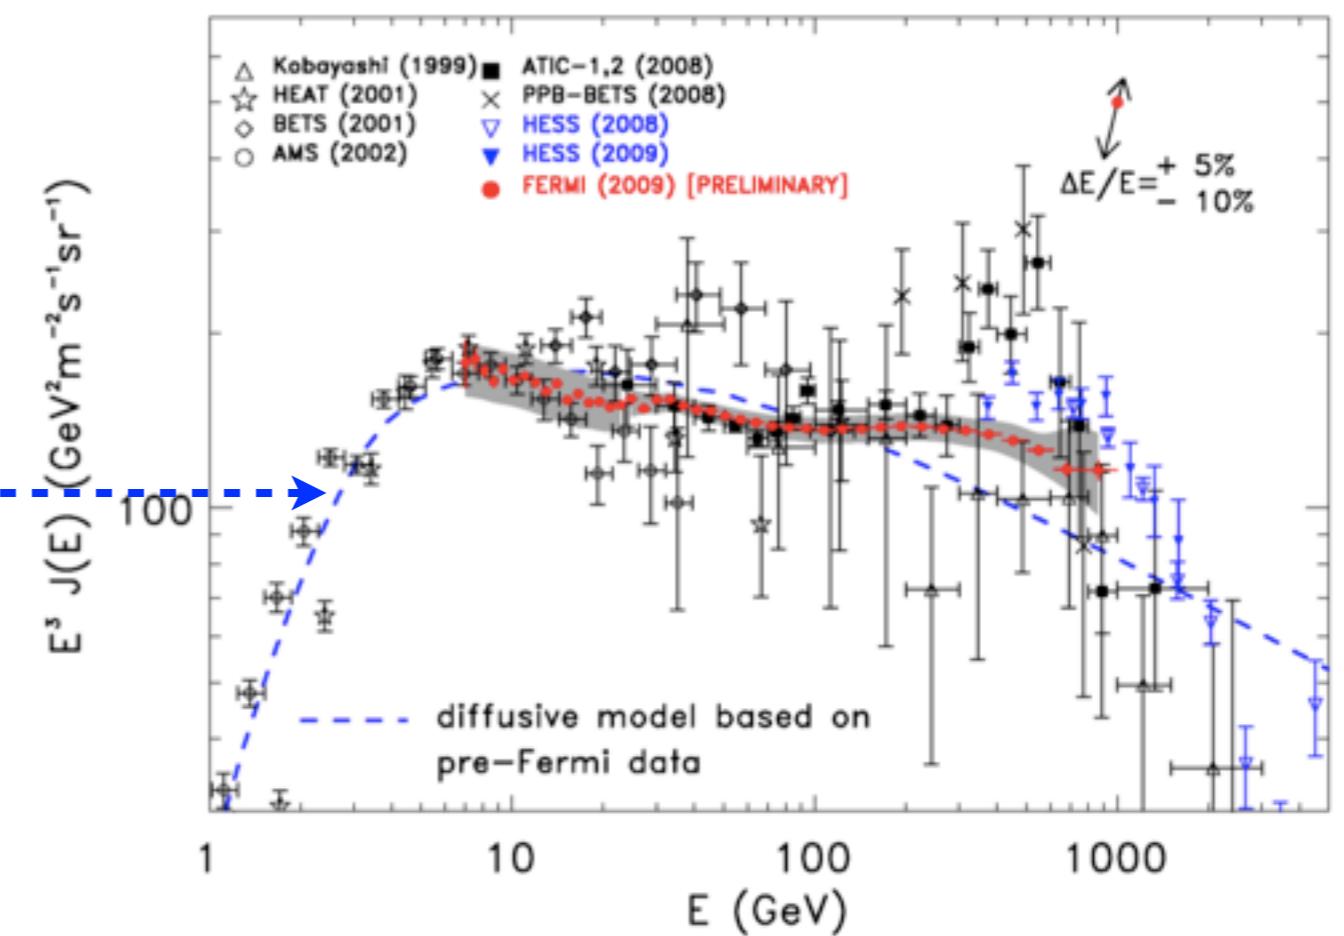

# Explains Observed Excesses

PAMELA:  $e^+$  fraction

Fermi:  $e^+ + e^-$  flux

no accompanying proton excesses  $\Rightarrow m_{A'} < 2m_p$

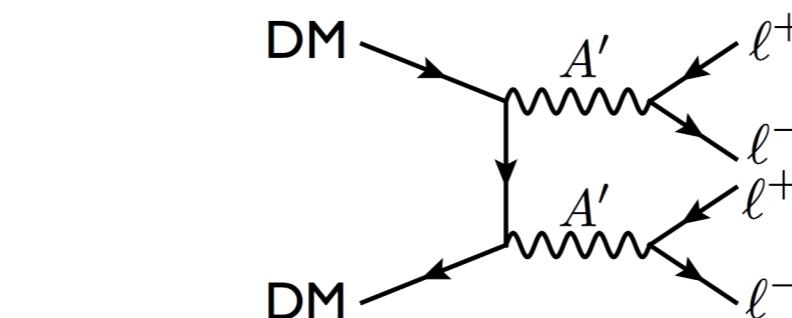

(Improved measurements from AMS-02 ~1-2 year)

# More Indirect Searches

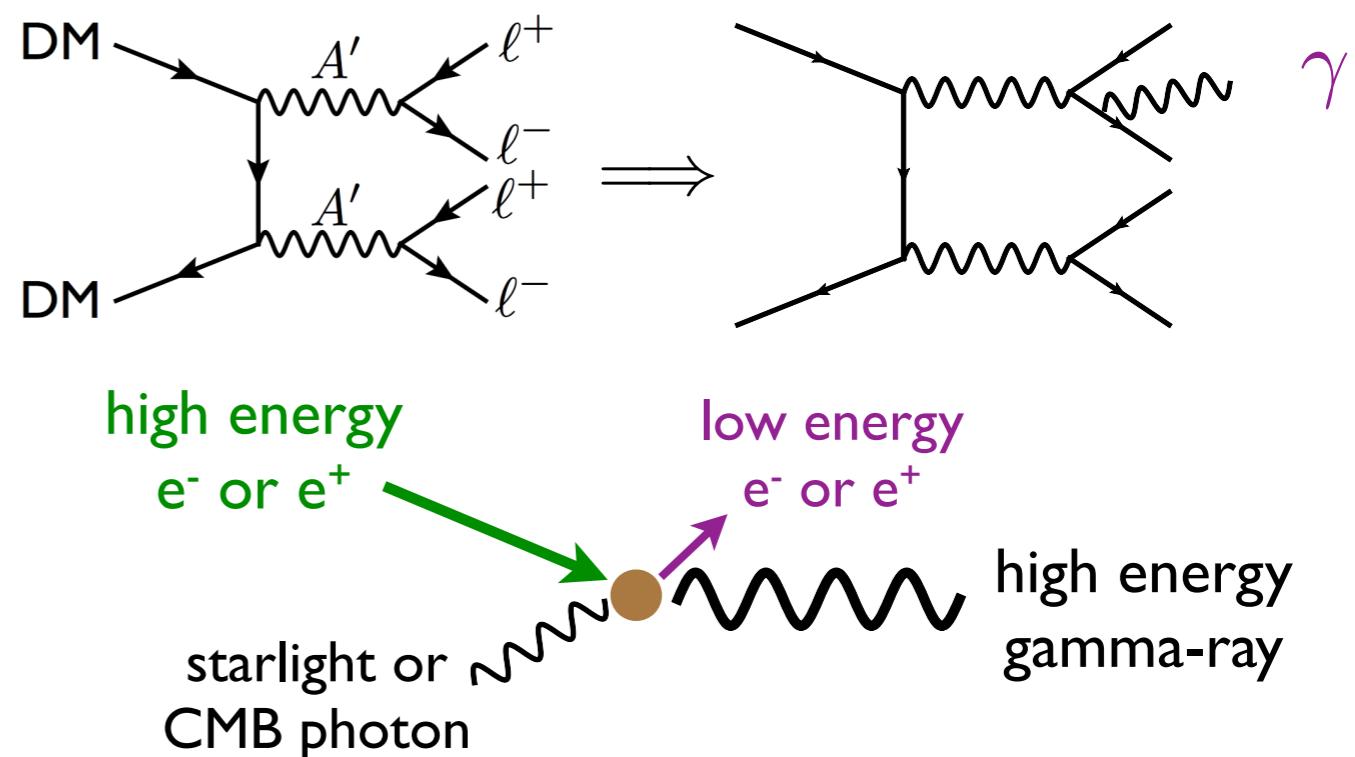

- Expect gammas  
(Fermi, Cherenkov Telescopes...)

**final-state radiation**

**inverse compton scattering**

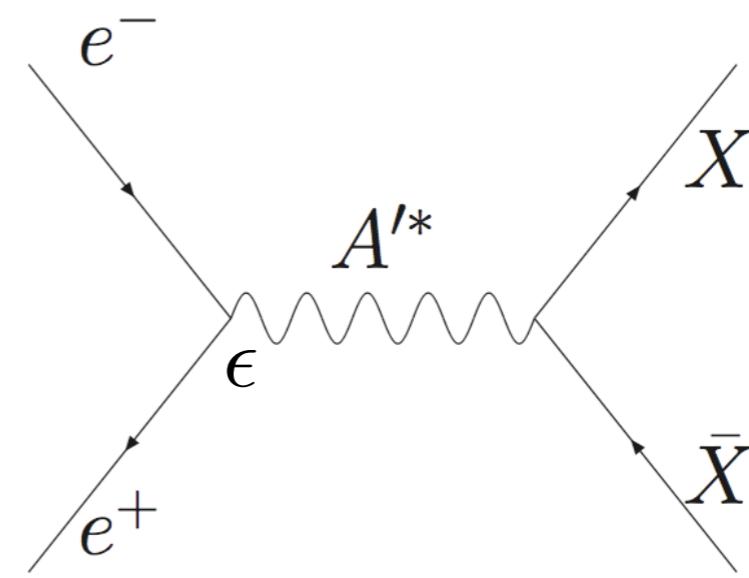

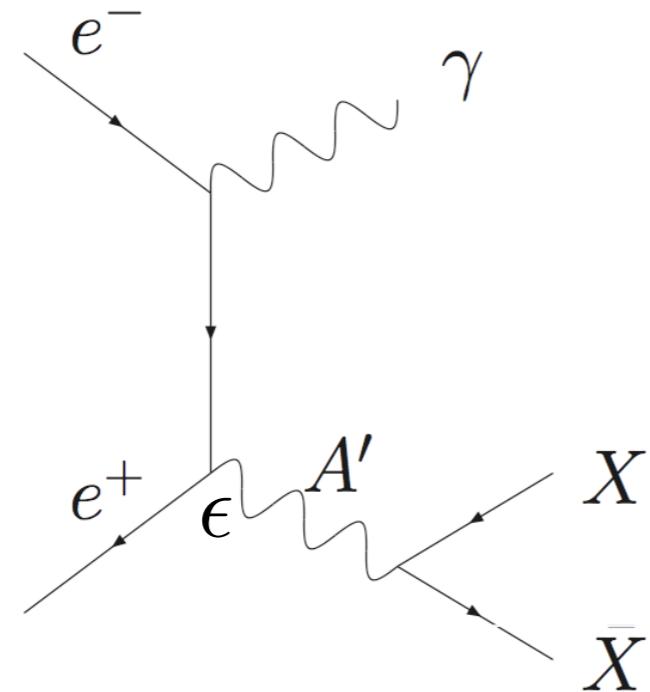

$$\begin{aligned} l &= \mu, \tau \\ \tau &\rightarrow \mu \bar{\nu}_\mu \bar{\nu}_\tau \\ \mu &\rightarrow e \bar{\nu}_e \bar{\nu}_\mu \end{aligned}$$

- Possibly neutrinos  
(IceCube, Super-K...)

**Searches underway, nothing conclusive yet.**

# Direct Searches: production

Essig, Schuster, Toro  
Batell, Pospelov, Ritz  
Reece, Wang

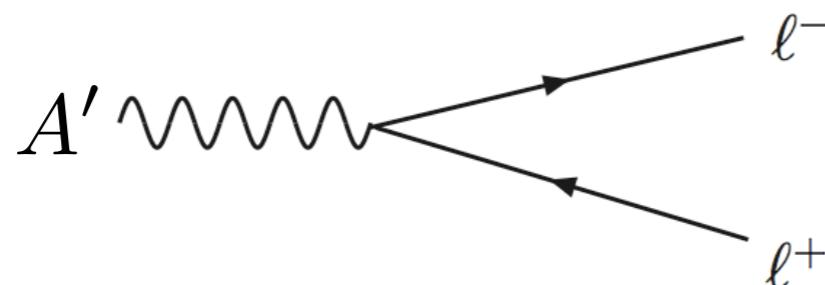

$X$  = Standard Model or hidden-sector particle

$$\sigma \propto \frac{\epsilon^2}{E_{cm}^2} \implies$$

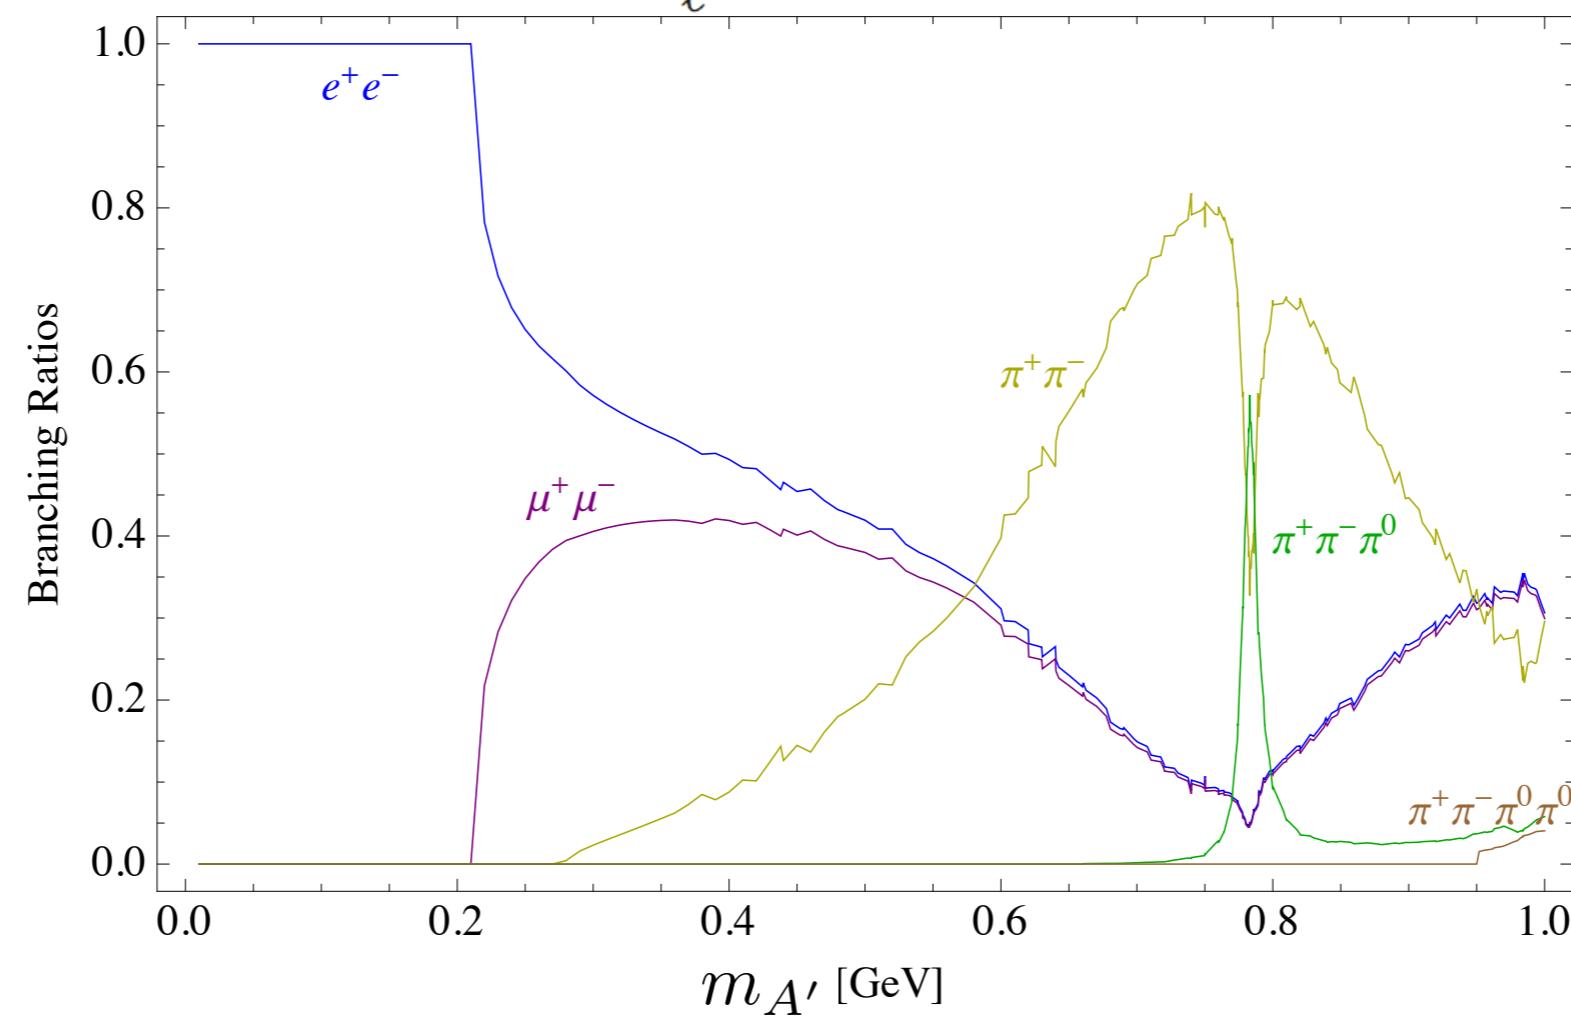

want **low-energy,**  
**high-luminosity** collider  
(BaBar, BELLE, KLOE, CLEO-c, BESIII, ...)

# A' Decays

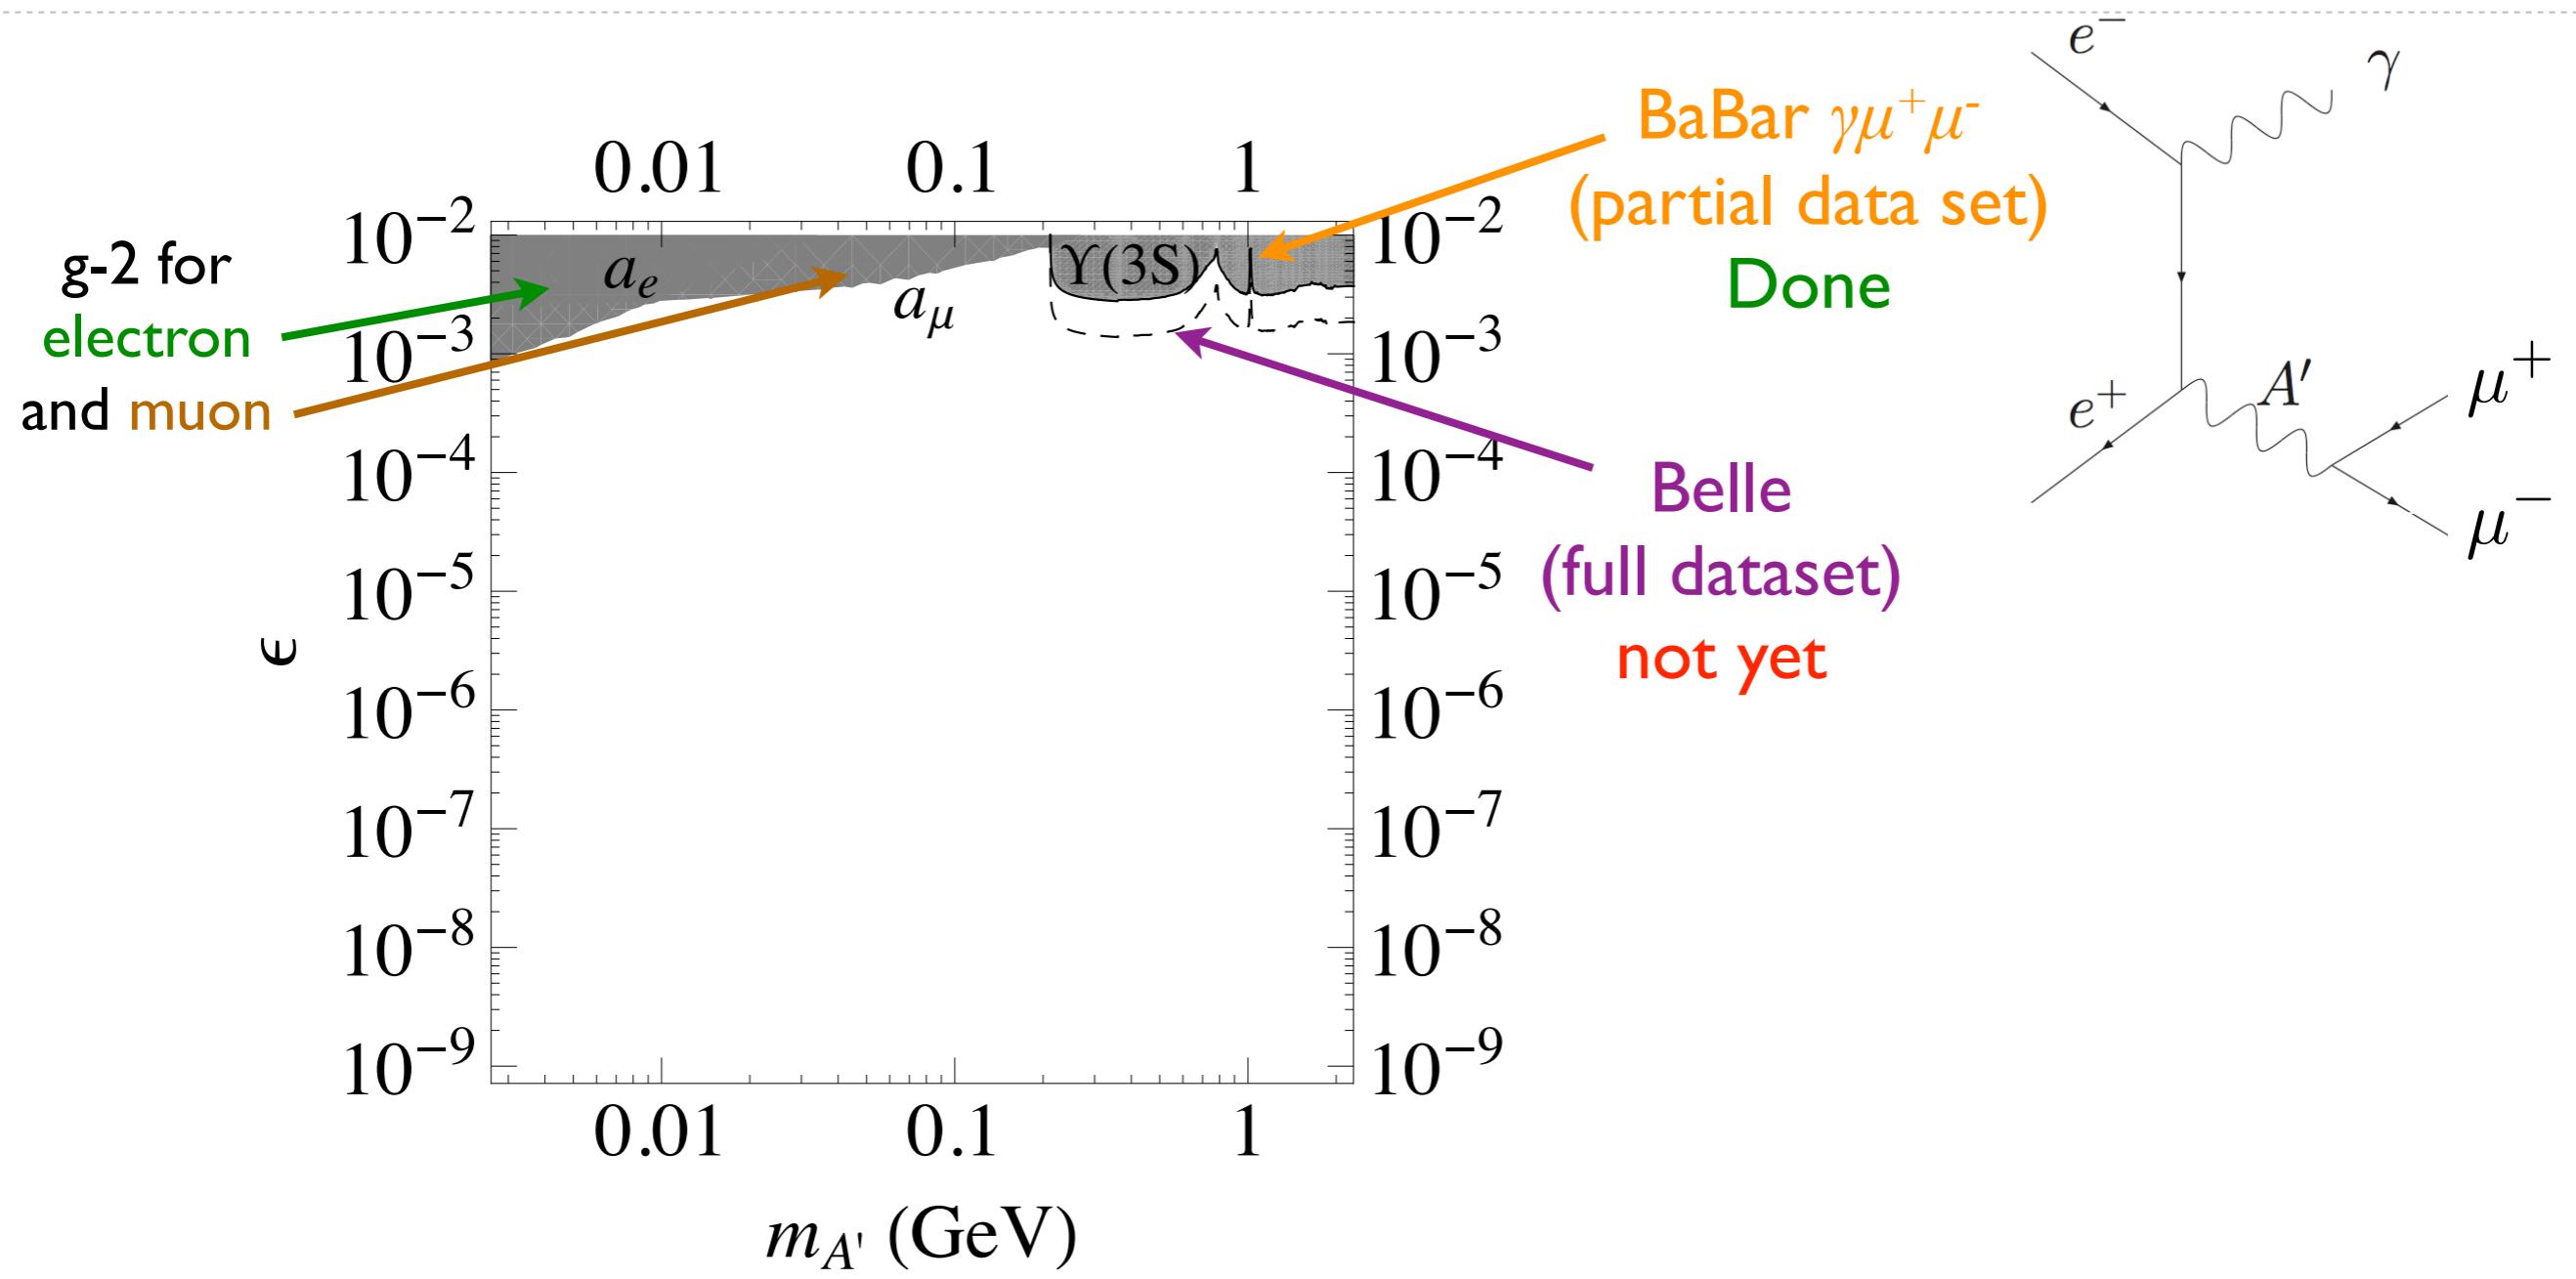

Can decay directly  
to Standard Model

# Direct Searches: $e^+e^-$

10

# Direct Searches: meson decays

$$\pi^0 \rightarrow \gamma A' \rightarrow \gamma e^+ e^-$$

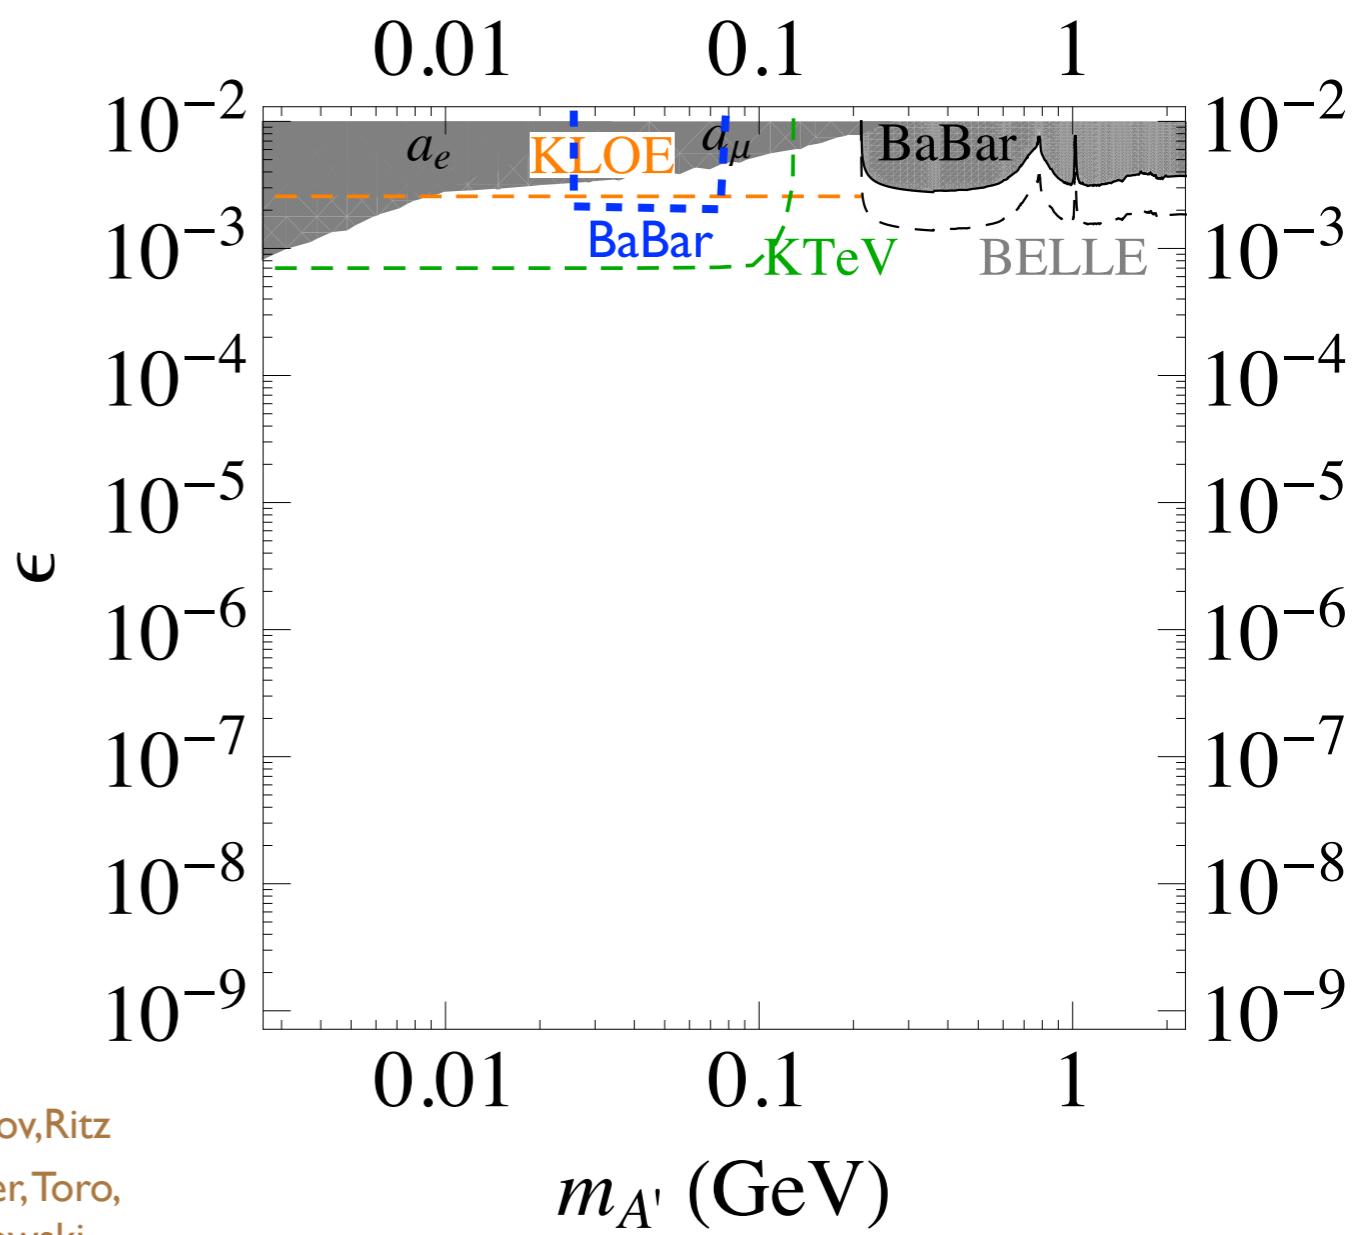

**BaBar**  $\sim$  few  $\times 10^9 \pi^0$   
(analysis ongoing)

**KTeV**  $\sim 10^{10} \pi^0$   
(sensitivity [over?]estimated)

$$\phi \rightarrow \eta A' \rightarrow \eta e^+ e^-$$

**KLOE**  $\sim 10^{10} \eta^0$   
(analysis underway)

Pospelov  
Reece, Wang  
Batell, Pospelov, Ritz  
Essig, Schuster, Toro,  
Wojtsekhowski

# Fixed Target

[Bjorken, Essig, Schuster, Toro]

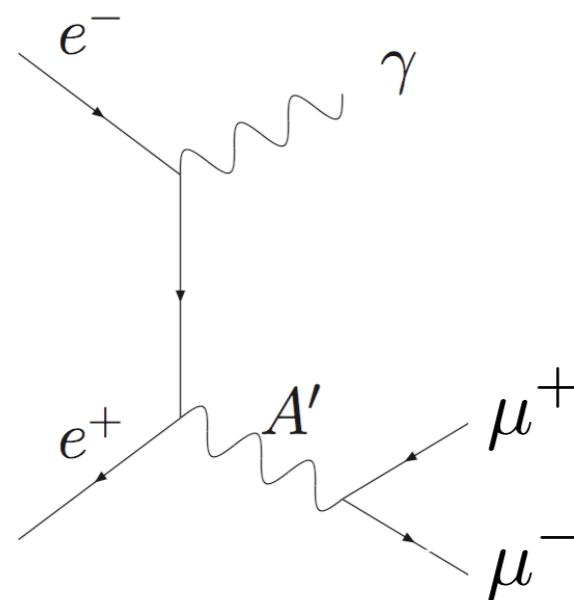

[Batell, Pospelov, Ritz]

[Reece & Wang]

## Collider

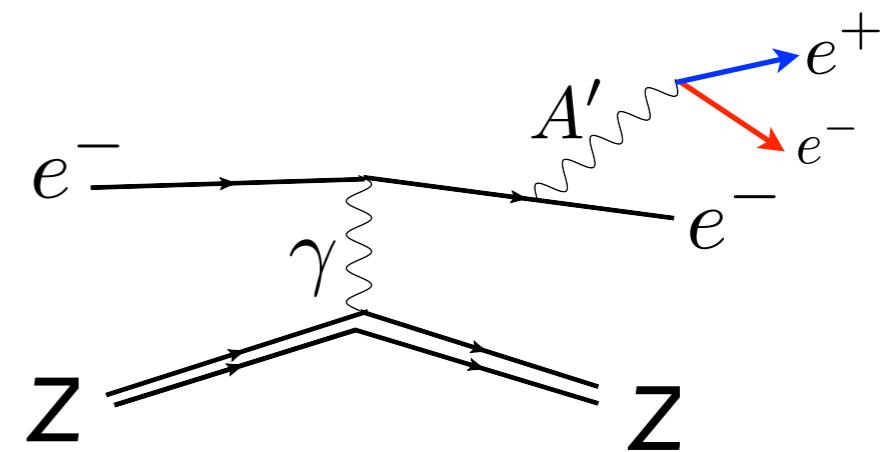

vs.

## Fixed Target

$$\sigma \sim \frac{\alpha^2 \epsilon^2}{E^2} \sim O(10 \text{ fb})$$

$O \text{ ab}^{-1}$  per decade

$$\sigma \sim \frac{\alpha^3 Z^2 \epsilon^2}{m^2} \sim O(10 \text{ pb})$$

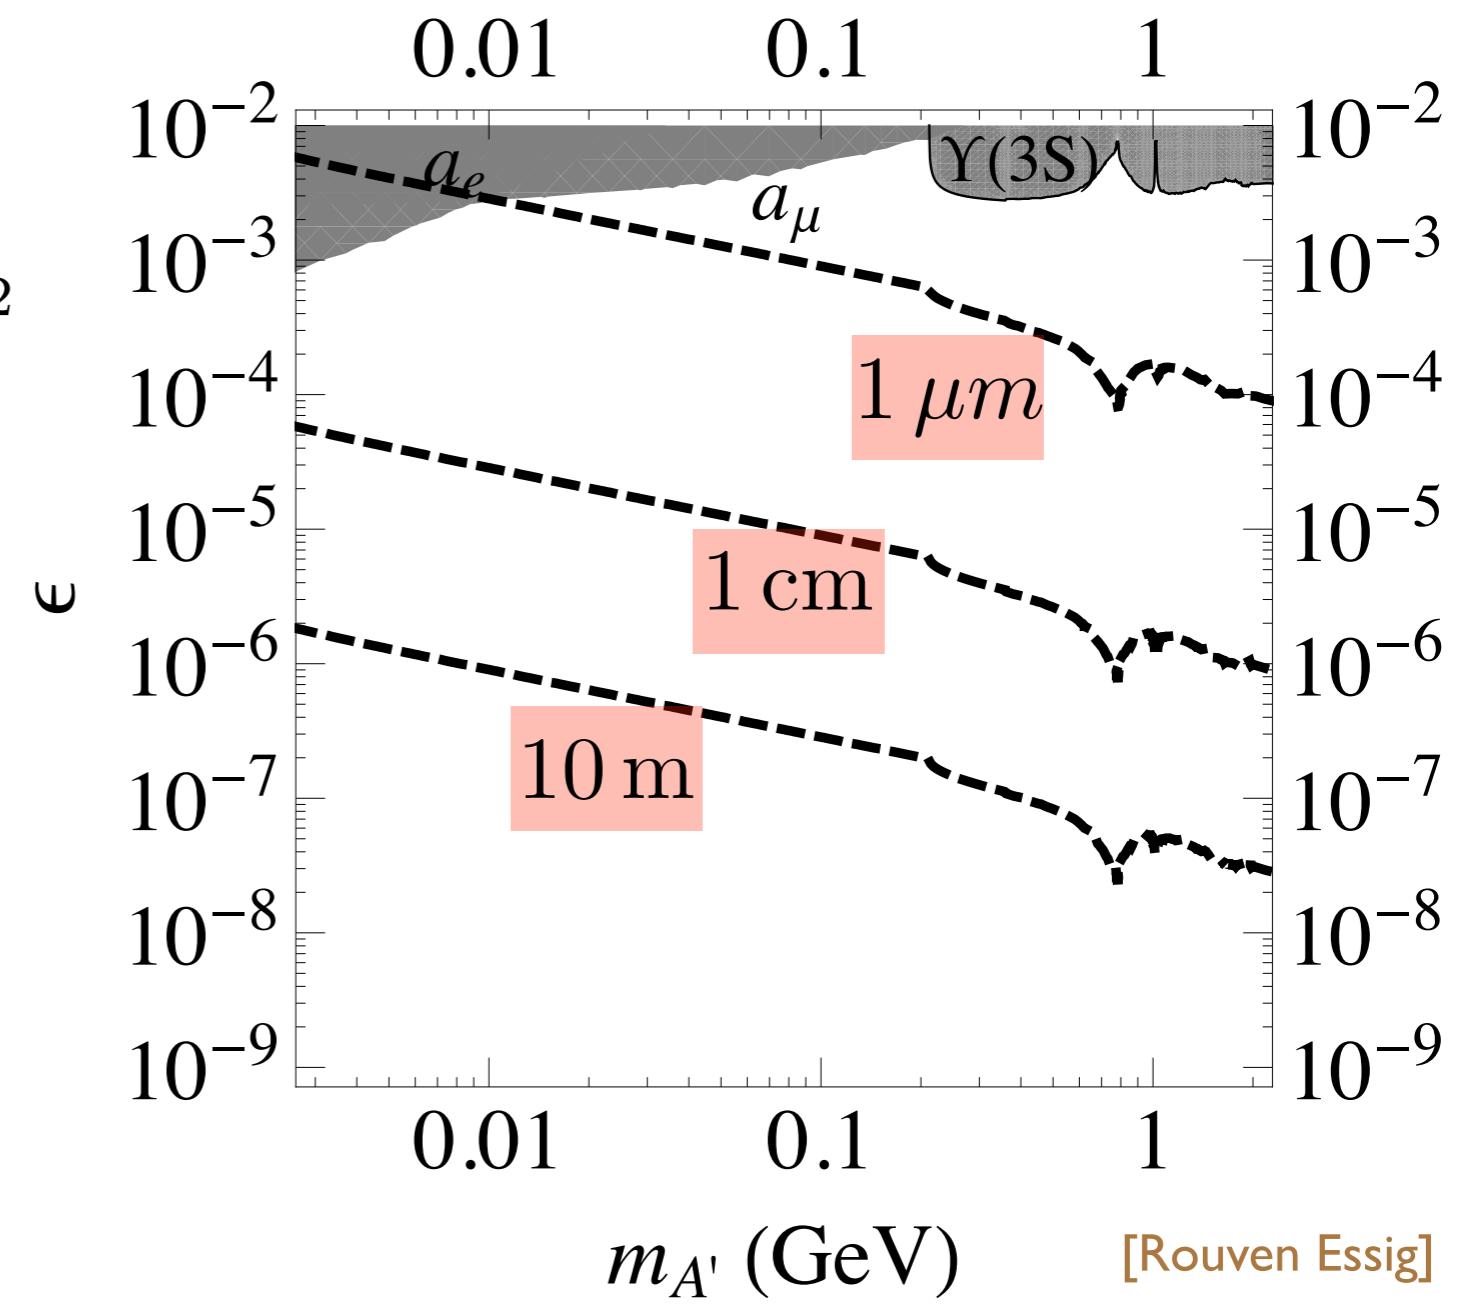

$O \text{ ab}^{-1}$  per day

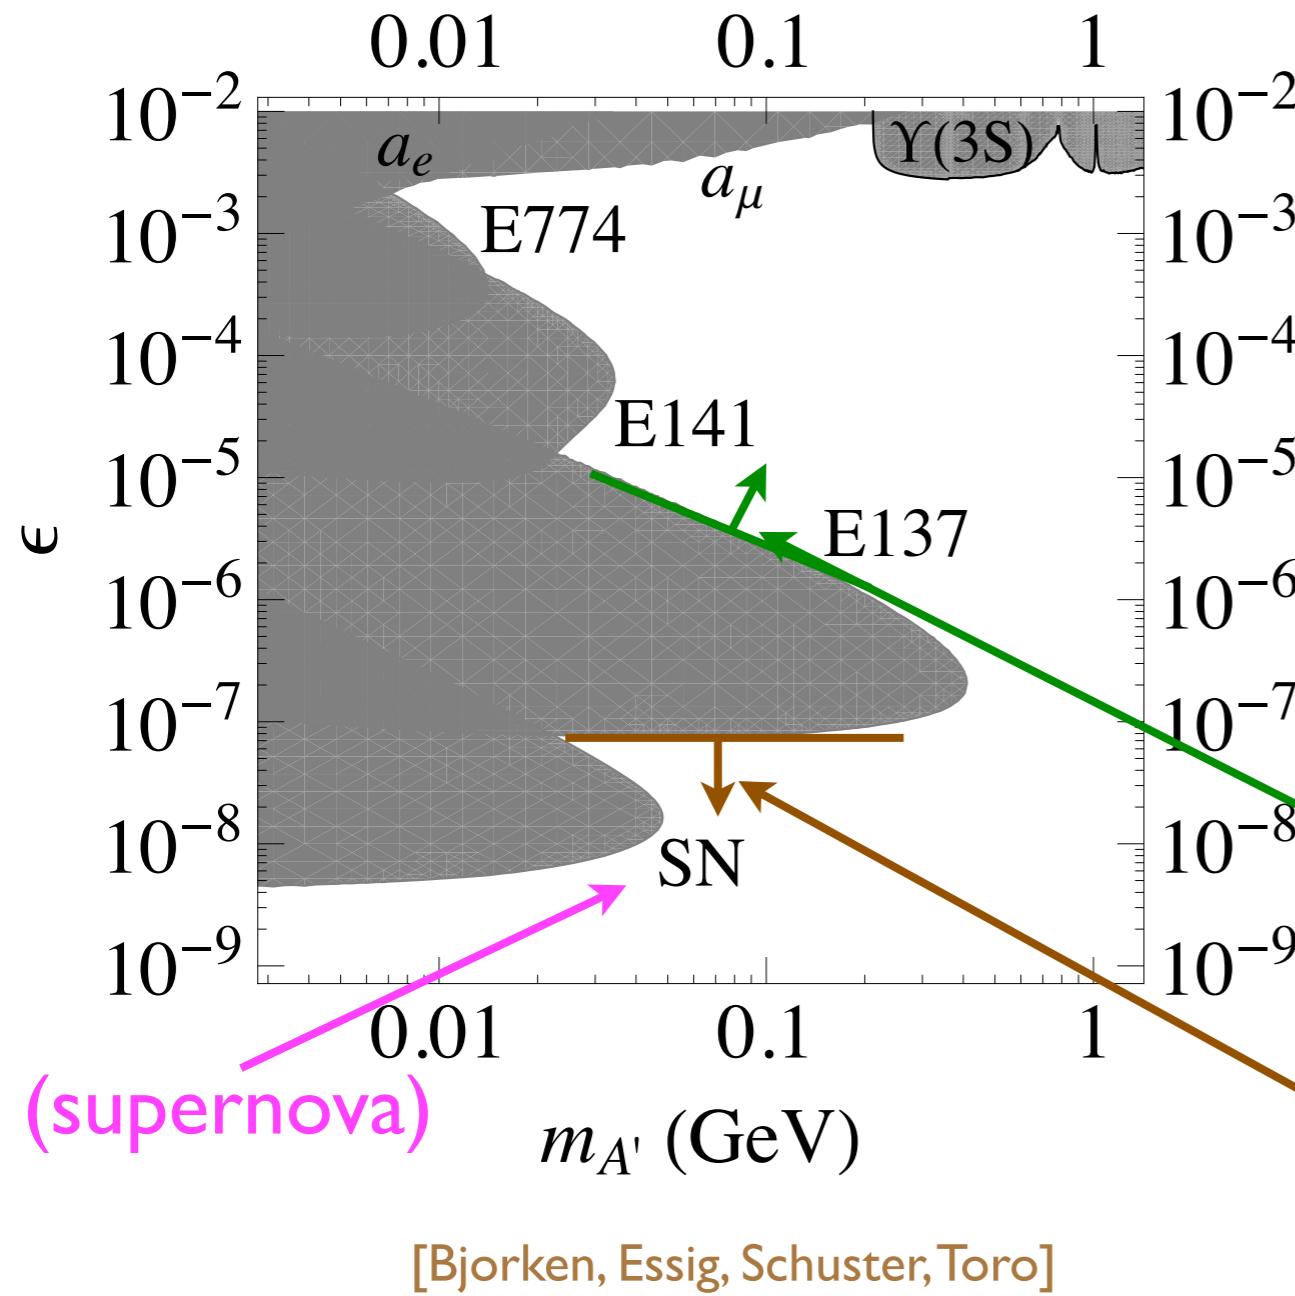

# A' Lifetime

$$\gamma c\tau \propto \left(\frac{10^{-4}}{\epsilon}\right)^2 \left(\frac{100 \text{ MeV}}{m_{A'}}\right)^2$$

**At small couplings,  
A' is long-lived!**

# Fixed Target: Beam Dump

	Shield (m)	$E_{\text{beam}}$ (GeV)	Lumi (e $^-$ )
EI37	200	20	$10^{20}$
EI41	0.12	9	$2 \times 10^{15}$
E774	0.3	275	$5 \times 10^9$

- A' decay products decay in shield (since lifetime too small)
- luminosity too small (since cross-section too small)

# New Experiments?

## HIPS: $e^-$ beam dump at DESY

[A. Ringwald, S. Andreas, E. Garutti, P. Bechtle,  
A. Lindner, C. Niebuhr, S. Ghazaryan, H. Ehrlichmann]

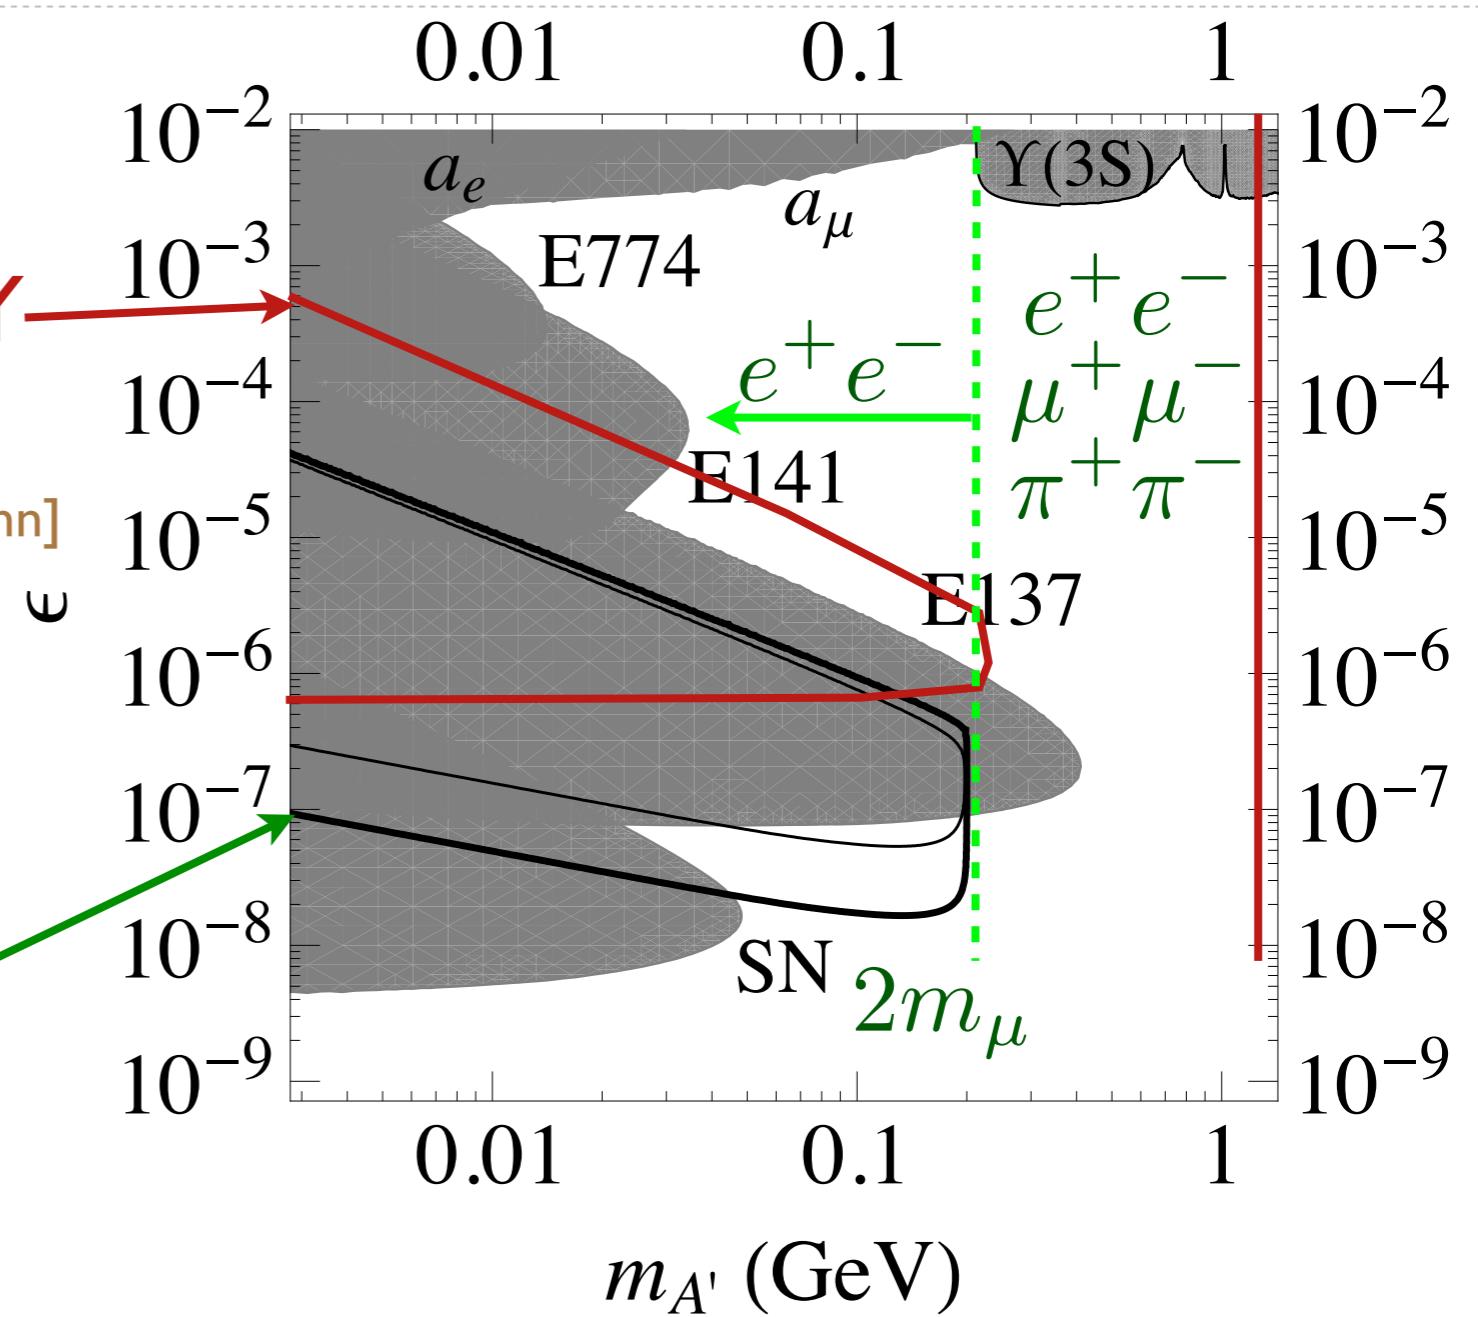

## Proton beam dumps

$$\pi^0 \rightarrow \gamma A' \rightarrow \gamma e^+ e^-$$

e.g. LSND  $\sim 10^{22}$  pions

[Batell, Pospelov, Ritz]

[Essig, Harnik, Kaplan, Toro]

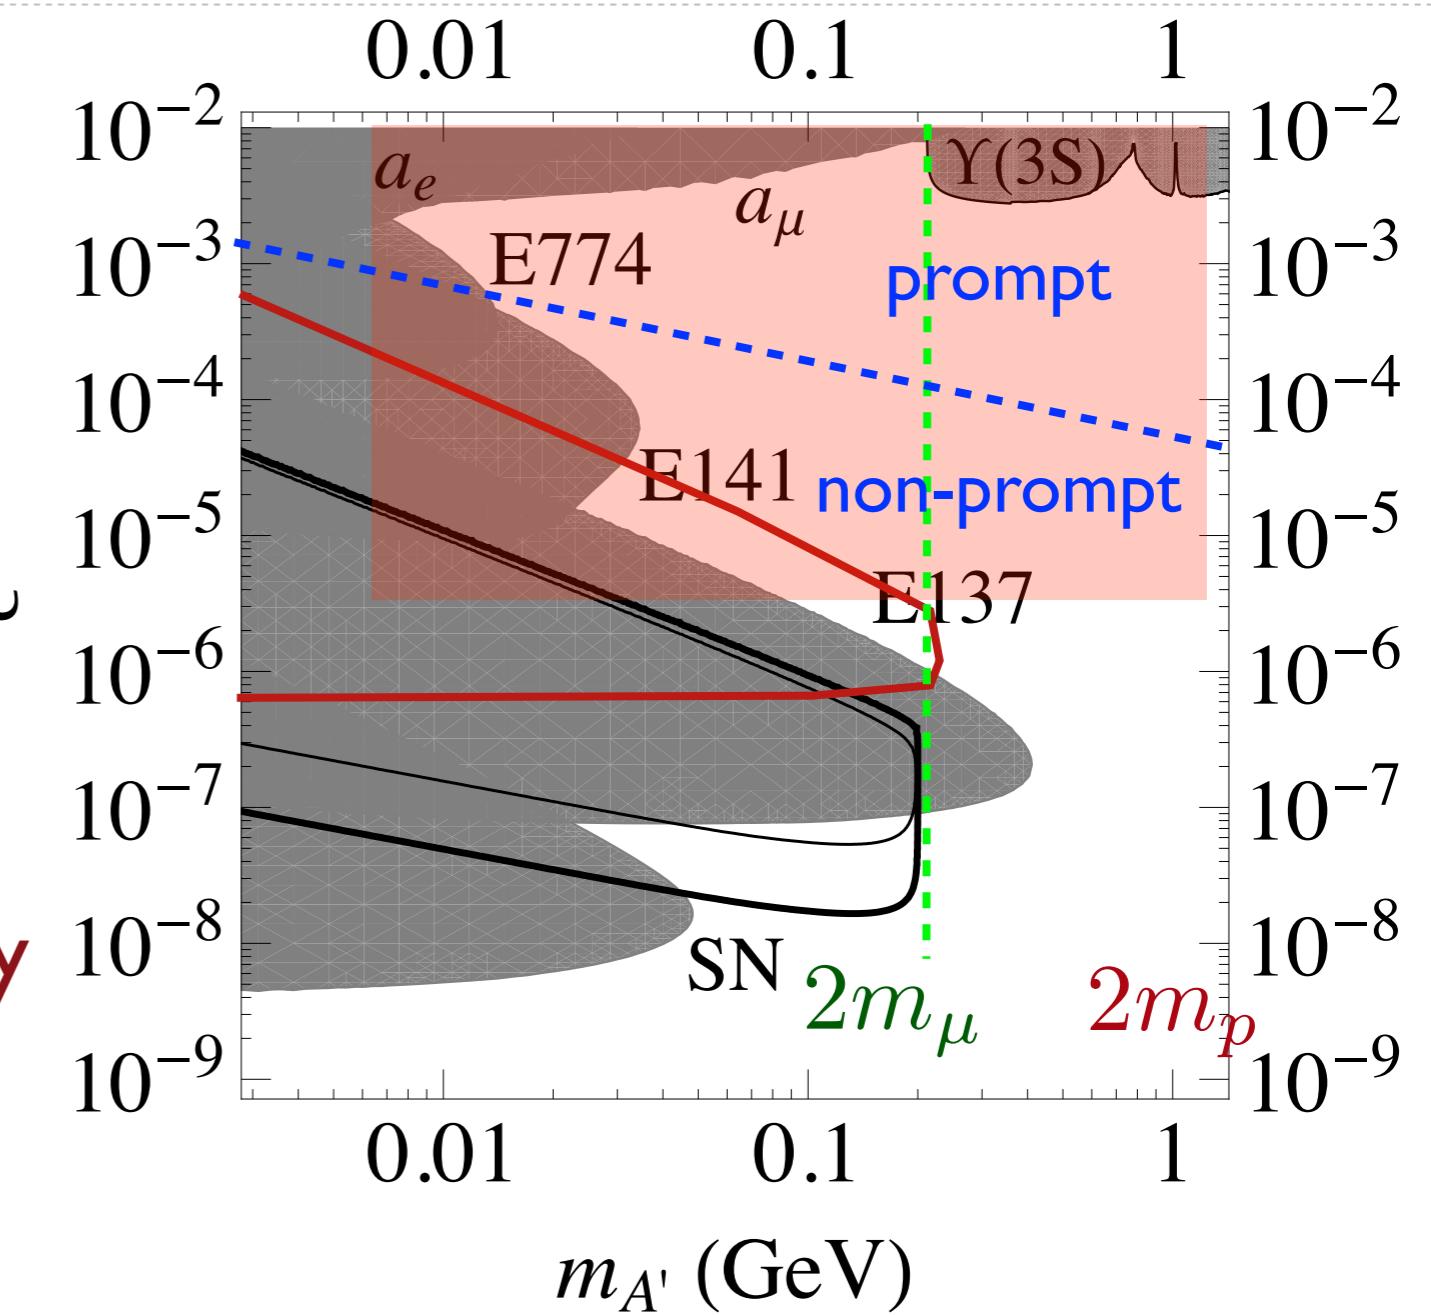

# New Experiments?

In simple models, expect:

- $\epsilon \sim 10^{-5} - 10^{-2}$
- $m_{A'} \sim \epsilon M_W \sim \text{MeV} - \text{GeV}$  for Higgs-like U(1)' breaking.

An interesting region not easily explored with beam dumps!

# HPS: The Elevator Pitch

Sensitivity in this region relies upon abilities to *precisely*...

- ❖ determine invariant mass of A' decay products (estimate momentum vectors)
- ❖ distinguish A' decay vertexes as non-prompt (extrapolate tracks to origin)

Placement of a tracking and vertexing system immediately downstream from a target and inside an analyzing magnet provides both measurements with high acceptance from a single, relatively compact detector.

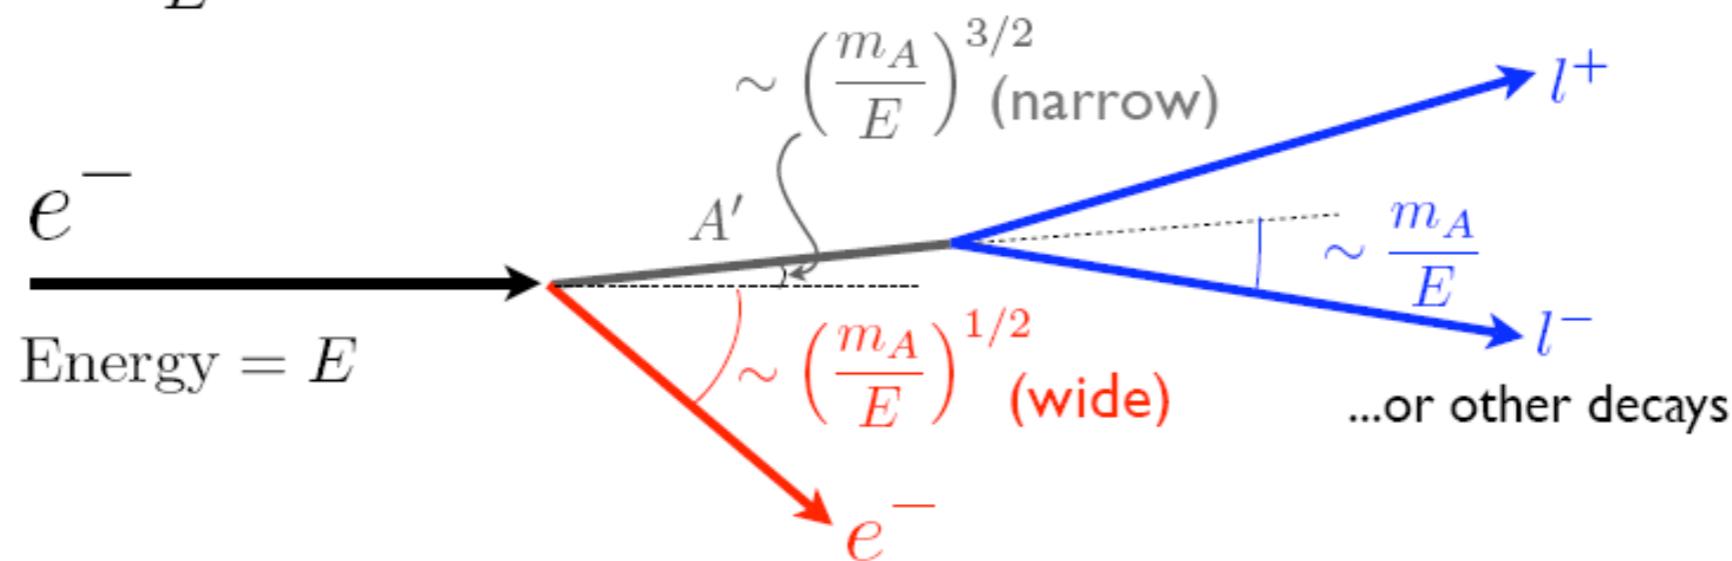

*"If they don't like our proposal I'll show them the kittens. Everybody likes kittens."*

# Fixed Target A' Kinematics

$$\frac{d\sigma}{dx} \propto \frac{\alpha^3}{\pi} \frac{\epsilon^2}{m_e^2 \cdot x + m_A^2(1-x)/x}$$

$$x = \frac{E_A}{E}$$

Kinematics **very different** from massless photon bremsstrahlung

Heavier product (here A') takes most of beam energy

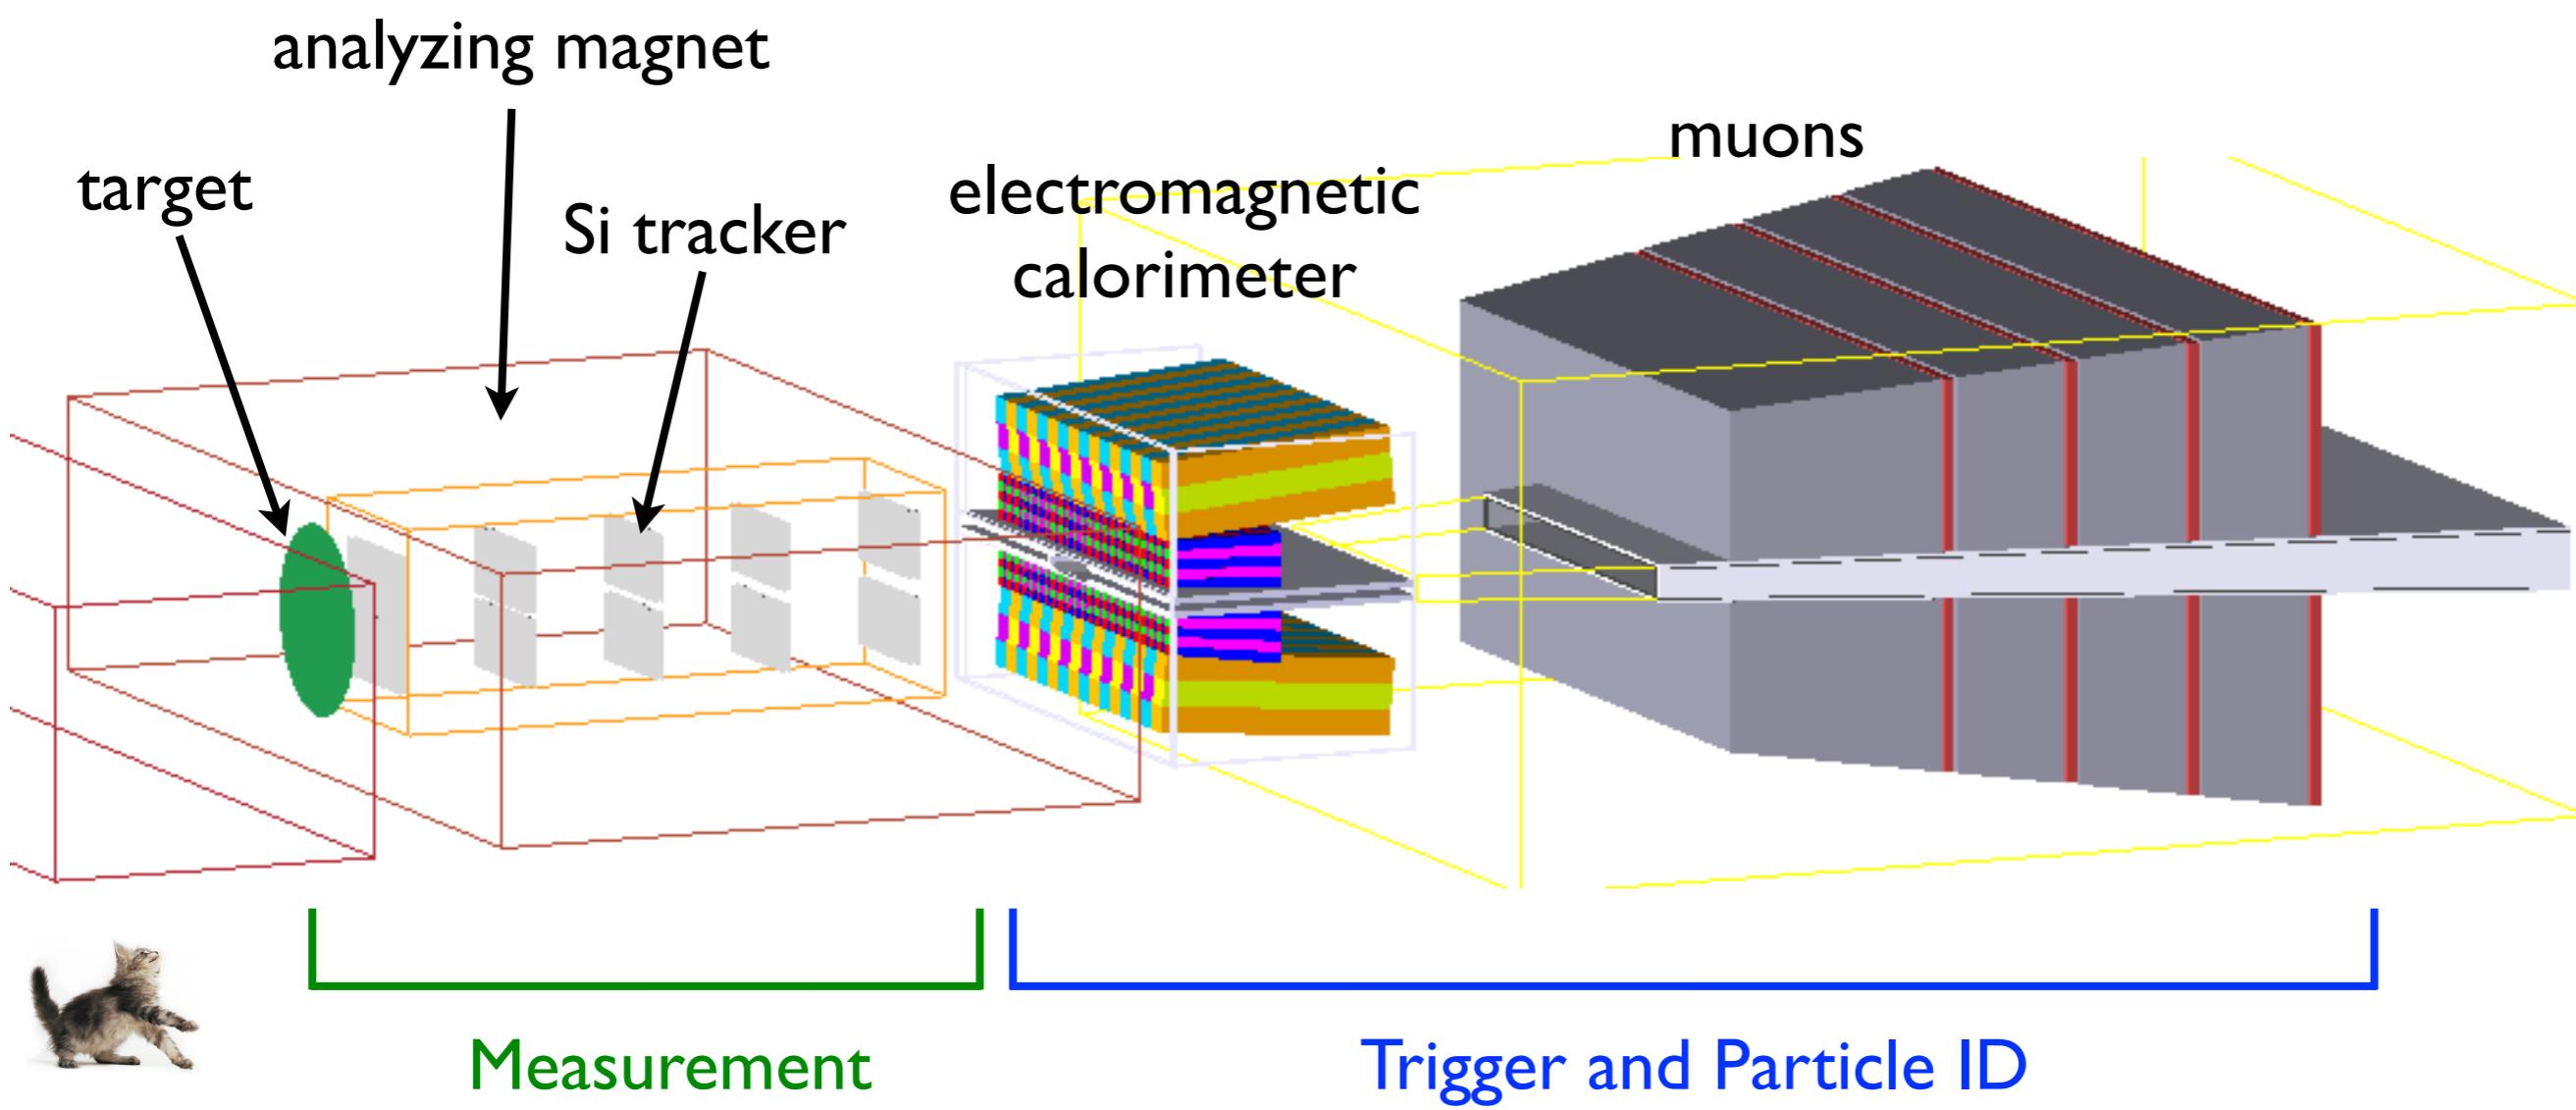

$$E_A \sim E - m_A$$

$$E_e \sim m_A$$

Efficient reconstruction of A' decays needs large, forward acceptance:  
 $\theta_{\text{decay}} = m_{A'}/E_{A'} (\sim 200 \text{ MeV}/6 \text{ GeV} = 33 \text{ mrad})$

# HPS Concept

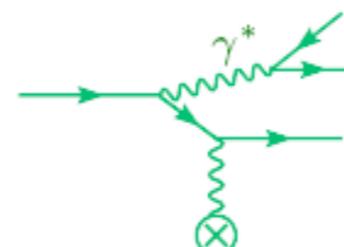

Measurement

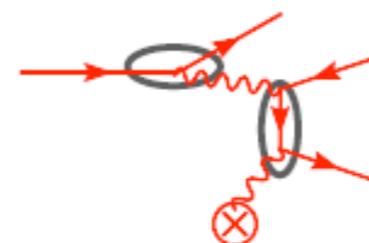

Trigger and Particle ID

# Backgrounds

- virtual photon conversion: irreducible

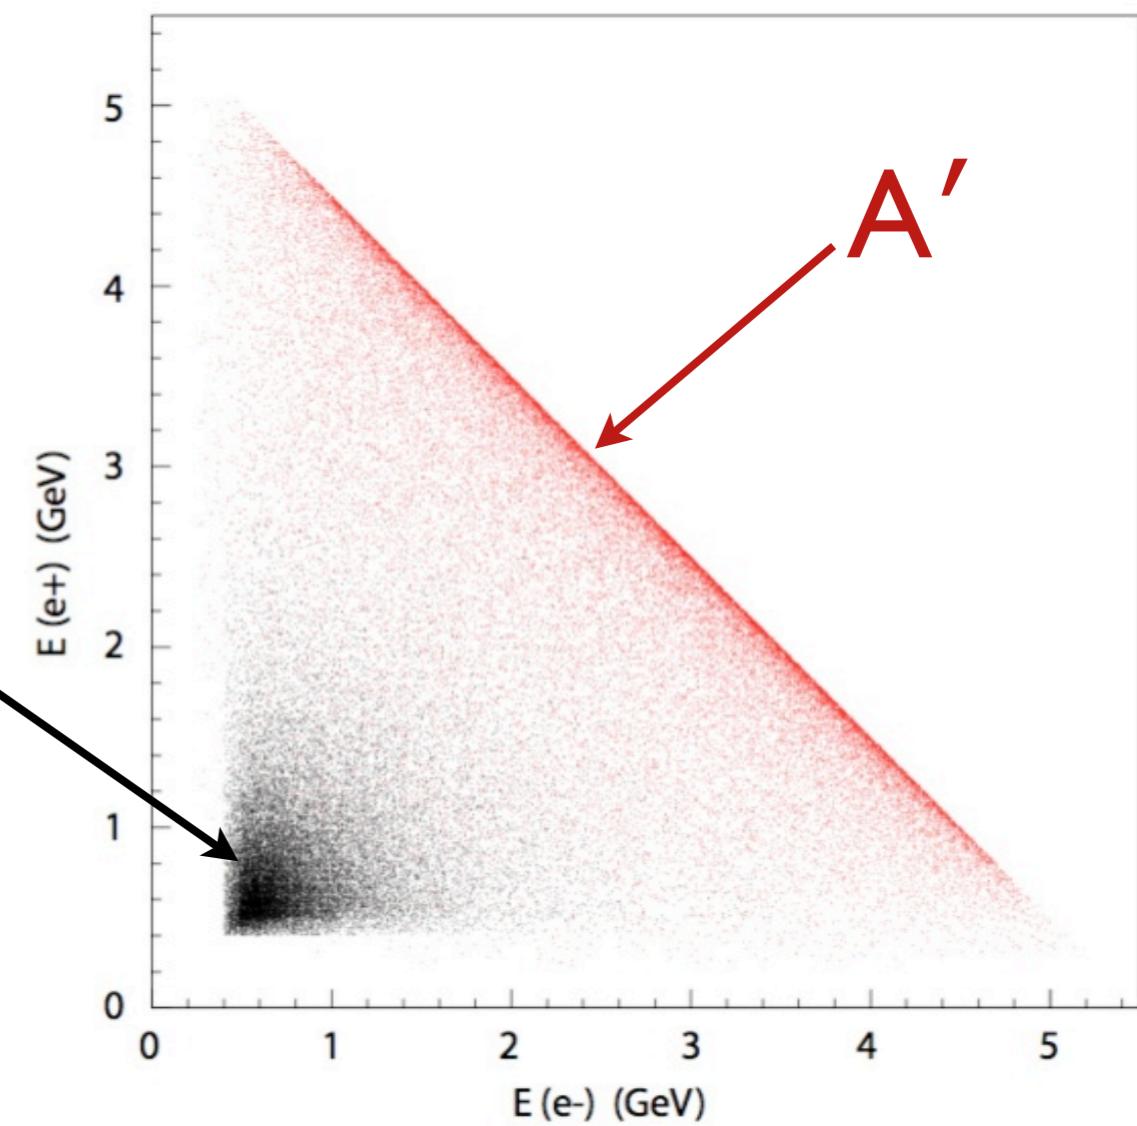

- Bethe-Heitler: dominant

- multiple coulomb scattering in target

- secondary particle production in target:  
bremsstrahlung and delta-rays

- pair conversion of bremsstrahlung photon:  
two-step process:  $\alpha (\text{target thickness})^2$

# Experimental Requirements

- Thin targets need to reduce backgrounds require high beam current to probe small cross sections:  $Q_{\text{tot}} \sim IC$  for  $T=0.25\% X_0$
- Manageable occupancies require ~DC beam to spread out background from IC of angry electrons as much as possible.
- Need fast detectors and electronics, fast and efficient trigger algorithms
- Good mass and vertex resolution are at the heart of sensitivity

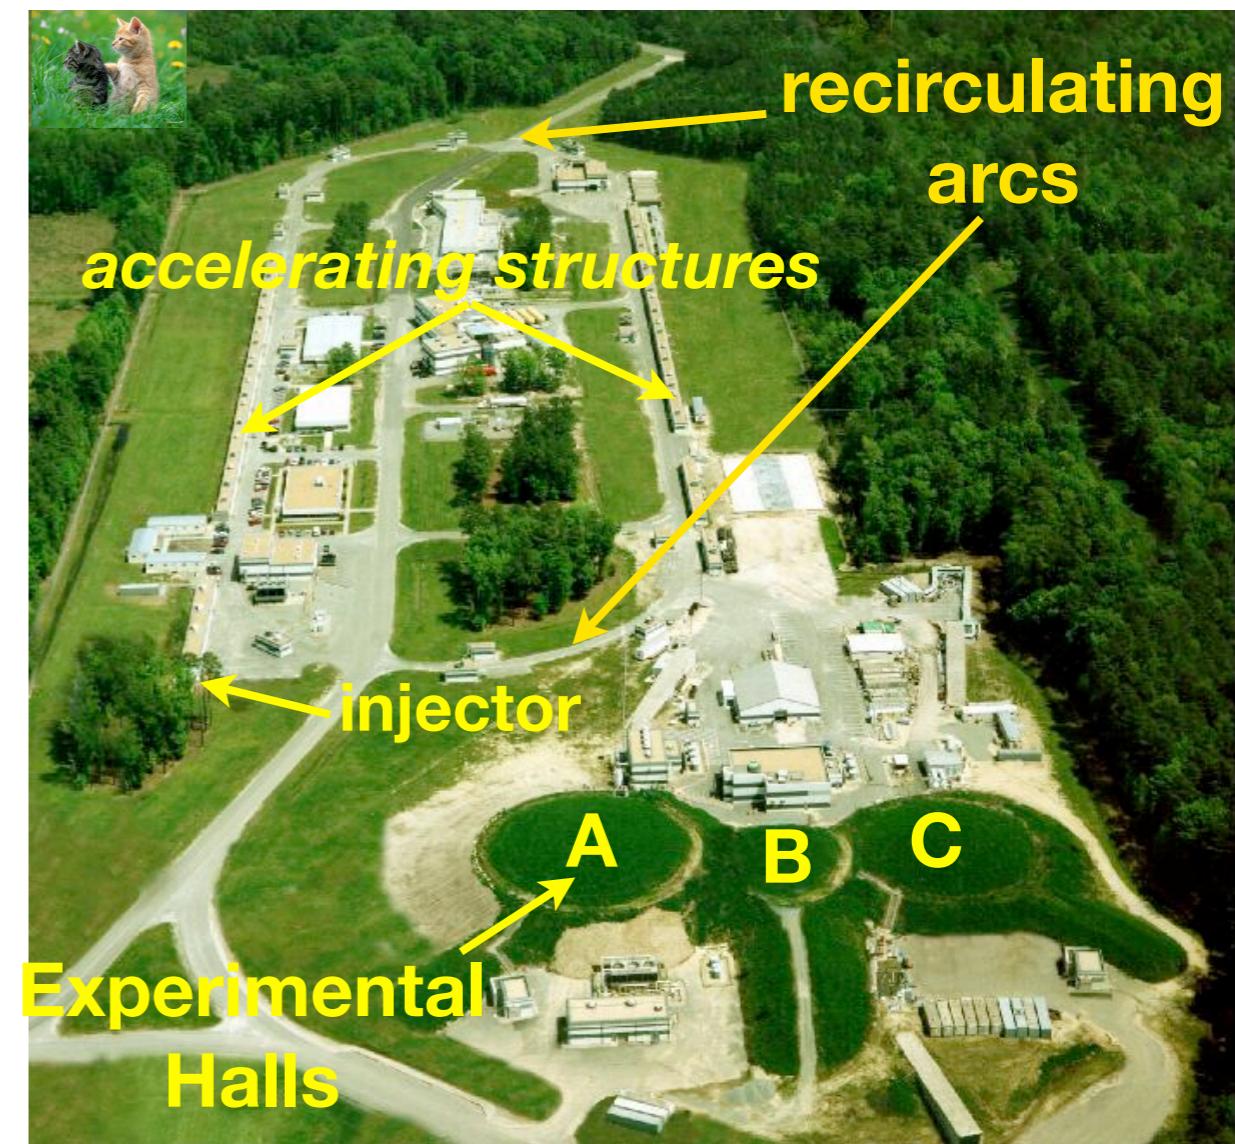

# CEBAF at JLab

Simultaneous delivery of electron beams at different energies and intensities in three experimental halls.

- ◆  $E_{\text{beam}} = n \times 1.1 \text{ GeV}$ ,  $n \leq 5$  (5.5 GeV Max)
- ◆  $I_{\text{beam}} < 100 \mu\text{A}$  (A&C),  $< 300 \text{ nA}$  (B)
- ◆ bunch separation: 2.004 ns
- ◆ energy upgrade complete 2014:  
 $E_{\text{beam}} = n \times 2.2 \text{ GeV}$ ,  $n \leq 5$  (11 GeV max)

Ideal for this experiment.

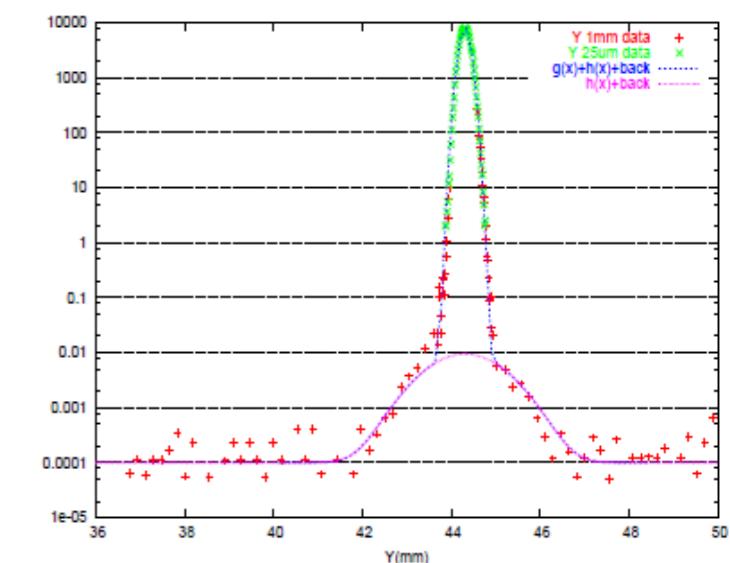

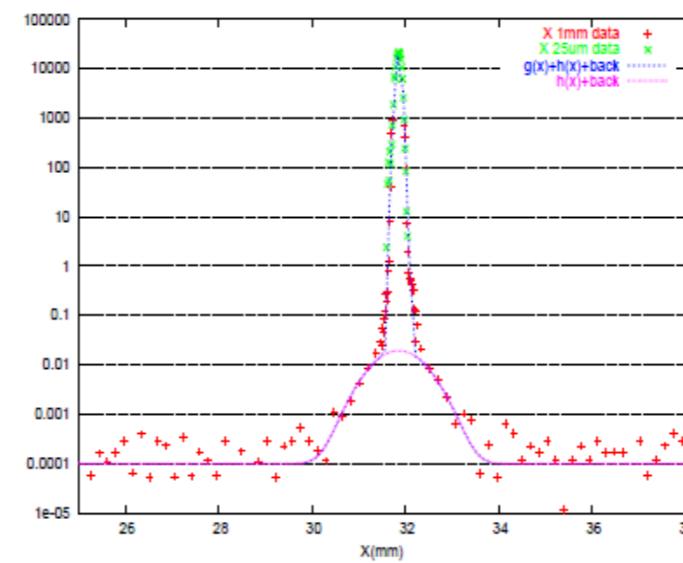

JLAB

# Beamline

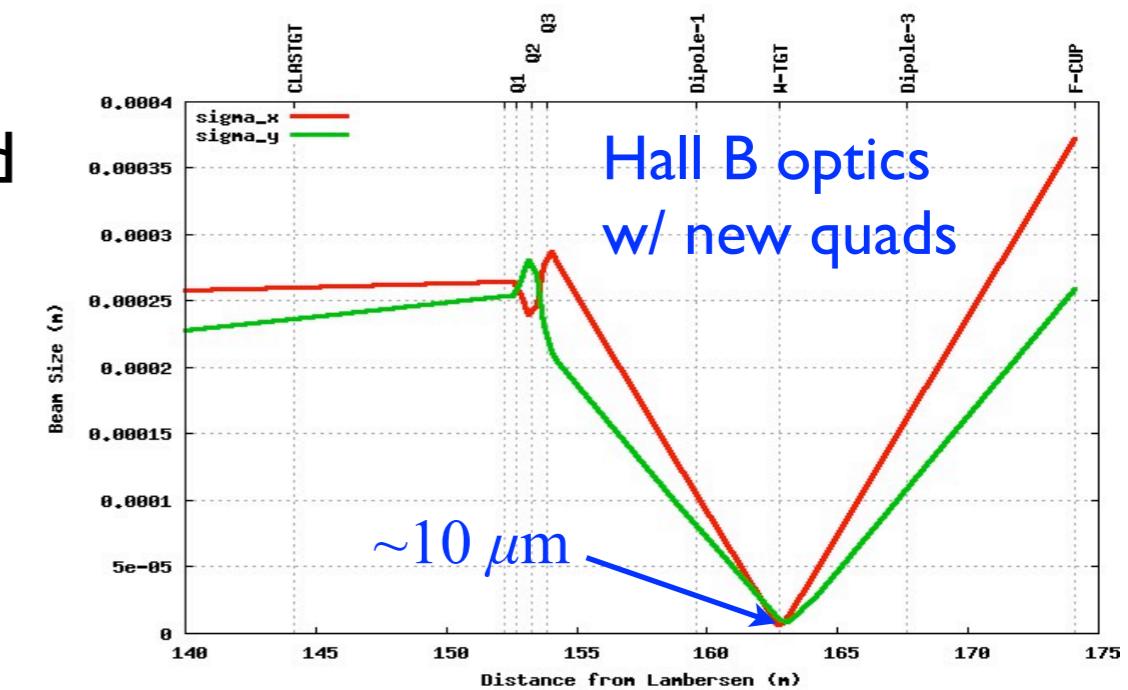

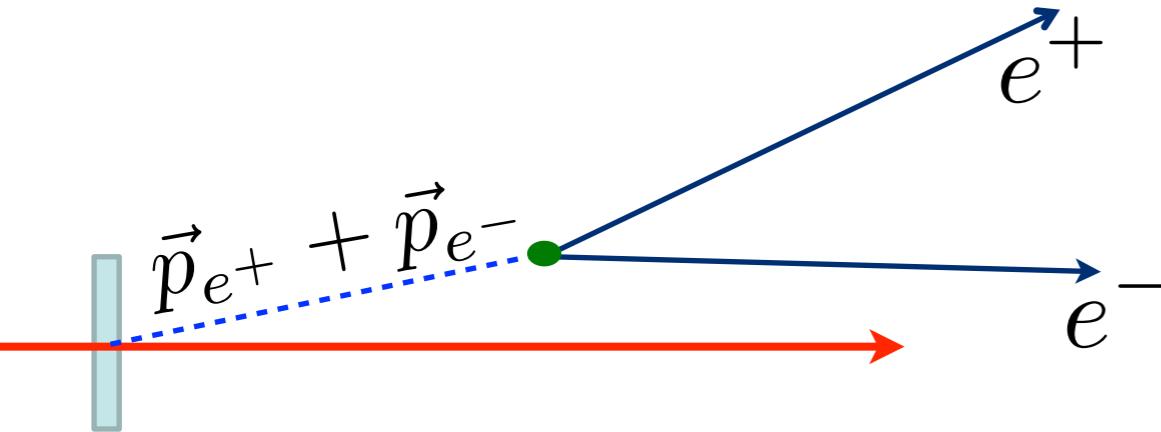

Excellent beam quality, stability

Beam Tail  $\sim 10^{-5}$

10  $\mu\text{m}$  spot possible with additional quads:  
constrains A' trajectory, reducing background

Hall B optics  
w/ new quads

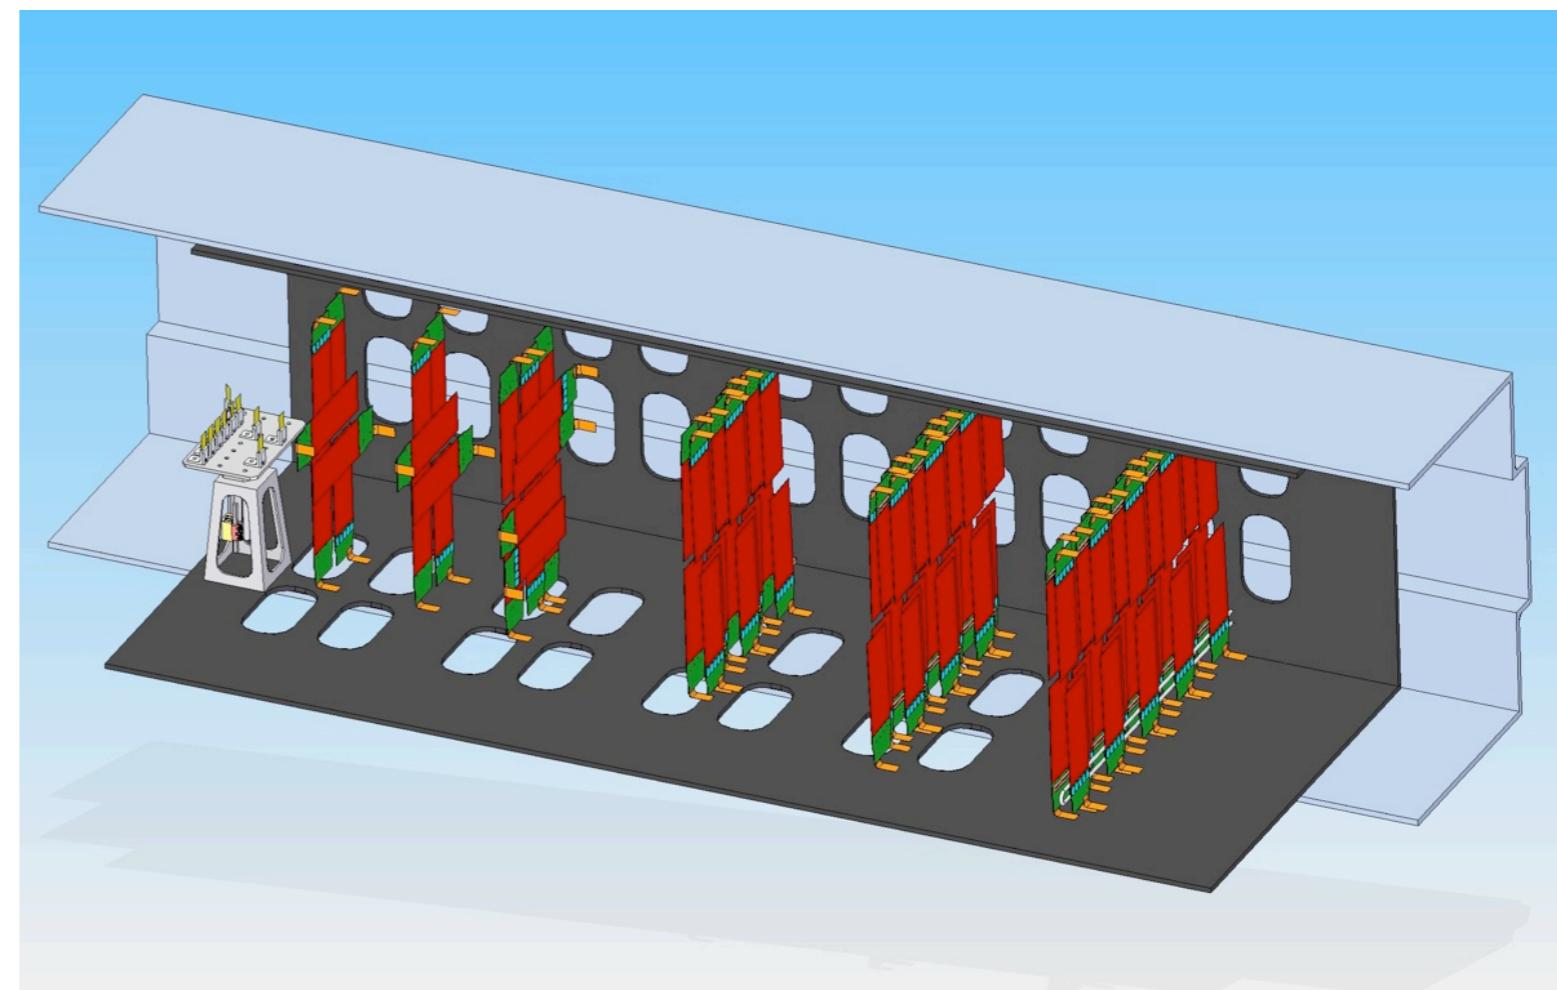

# Tracking/Vertexing Challenges

- ⬢ At relevant beam energies and interesting  $A'$  masses, decay products tend to be electrons with momenta order a few GeV. Multiple scattering...
  - ⬢ dominates both mass and vertexing measurement errors
  - ⬢ leads to pattern recognition mistakes in dense environments
- ⬢ Proximity to target means primary beam must pass through apparatus.
  - ⬢ scattered beam sweeps out a “dead zone” of extreme occupancy and radiation, compounded by beam-gas interactions
  - ⬢ puts low-mass acceptance in opposition to longevity and tracking purity
- ⬢ Long-lived  $A'$  signal very small: vertexing must be exceedingly pure to eliminate fakes.

# Challenges $\Rightarrow$ Design Principles

- ⬢ Mass and vertex resolution
  - ⬢ low-mass construction
- ⬢ Occupancies and radiation
  - ⬢ fast, robust sensors / readout
  - ⬢ movability / replaceability
  - ⬢ operation in vacuum
- ⬢ Acceptance/Purity
  - ⬢ optimized sensor layout

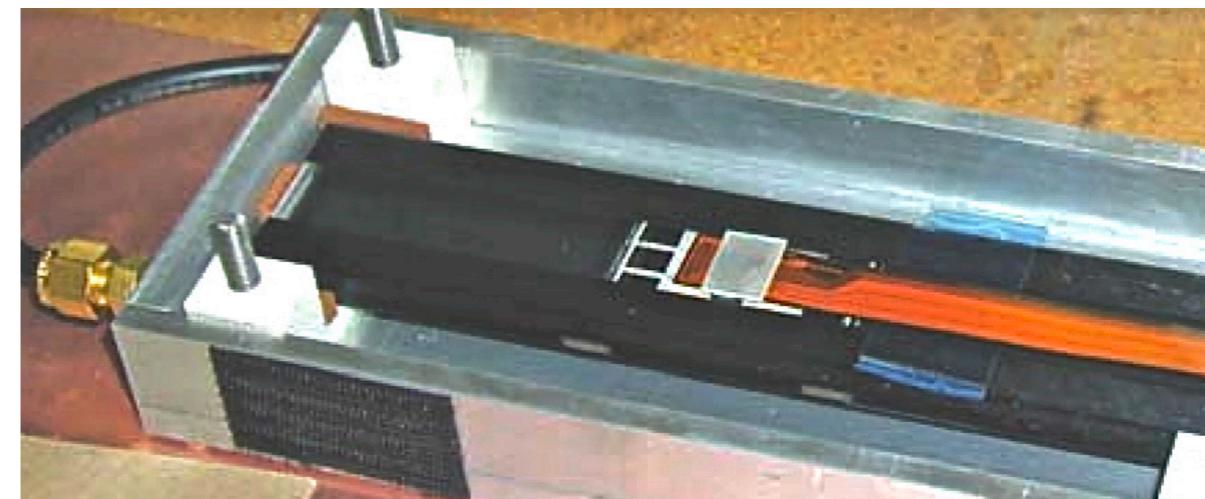

# Light, Fast, Robust Sensors

- ⬢ pixels too massive, costly, complex:  
microstrips are the simple,  
lightweight solution

## ⬢ Production Tevatron RunIIB sensors

- ⬢ many capable of 1000V bias:  
fully depleted to  $>4 \times 10^{15} \text{ e}^-/\text{cm}^2$
- ⬢ Fine readout granularity
- ⬢ Available in sufficient quantity

SLAC

# Dead Zone and Acceptance

Hits from  $A'$  daughters within acceptance;  
 $E_{\text{beam}} = 5.5 \text{ GeV}$ ,  $m_{A'} = 300 \text{ MeV}/c^2$

75 ns of beam at Layer 1

# Dead Zone Limits

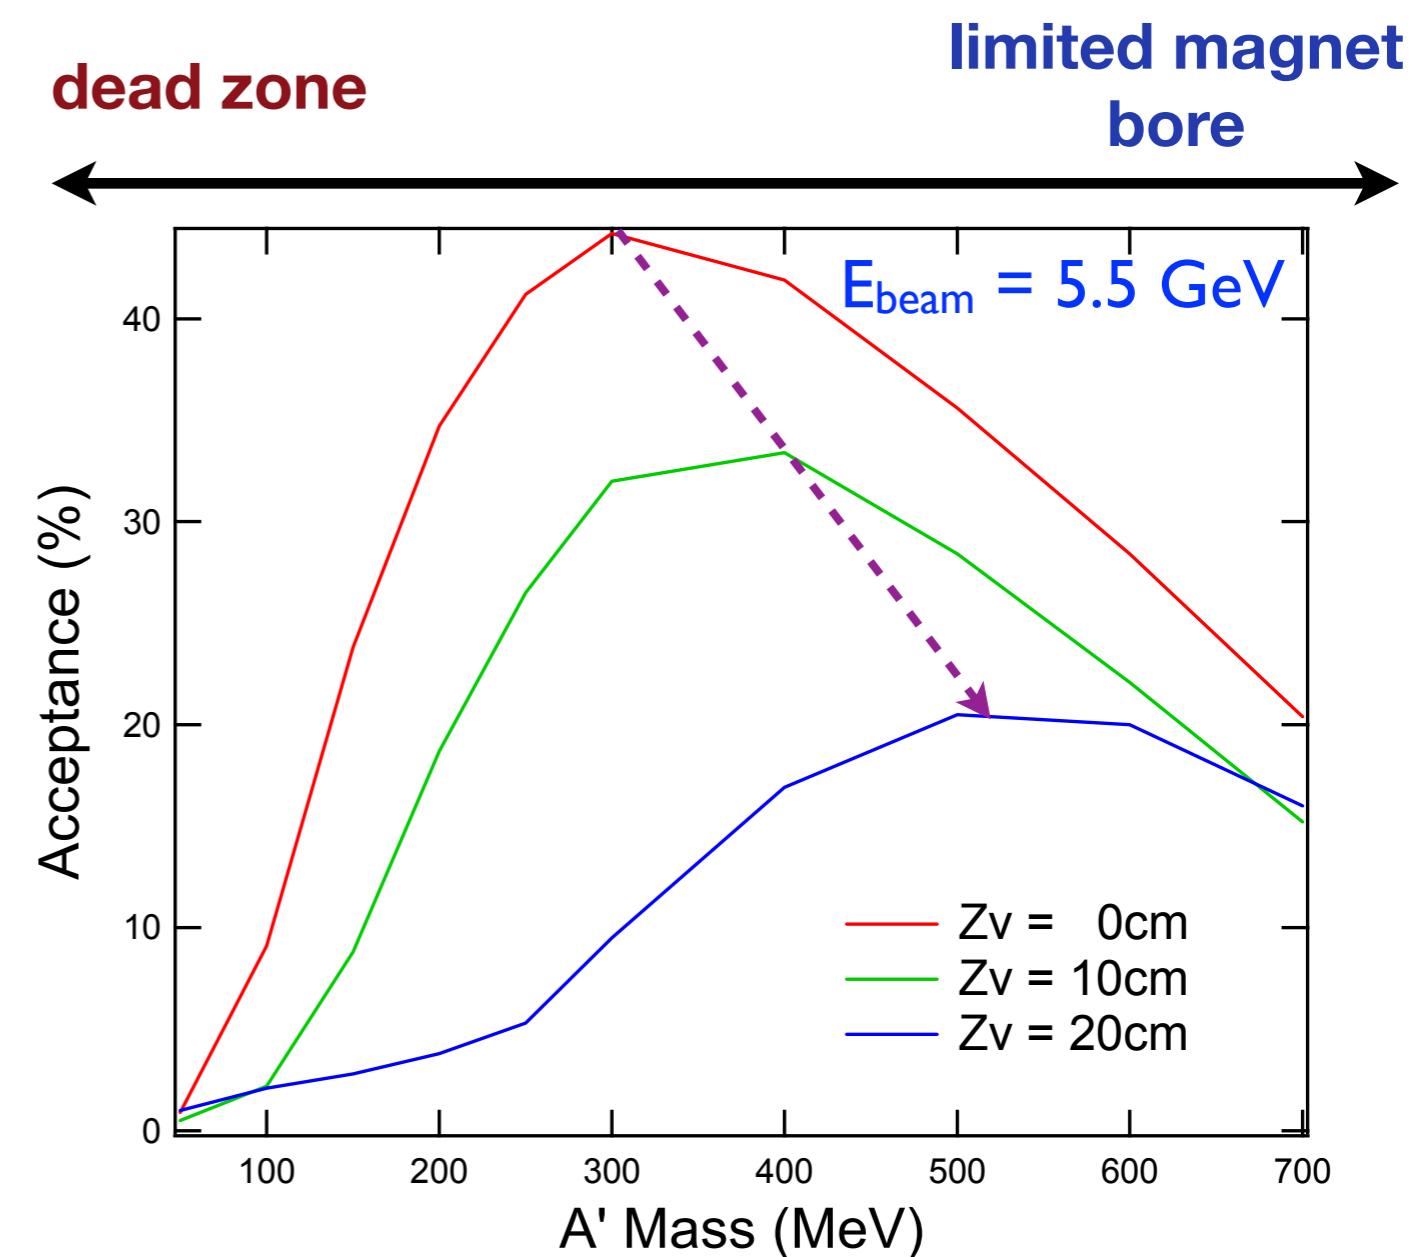

Layer I dead zone  $<\pm 1.5$  mm (15 mrad) allows for  $\sim 8$  months running at acceptable occupancies.

SLAC

# Tracker Acceptance

- At smaller masses, dead-zone limits acceptance
- At larger masses, losses due to limited coverage in layers 5 and 6 become important.
- Solid angle of dead zone increases with increasing z-vertex position

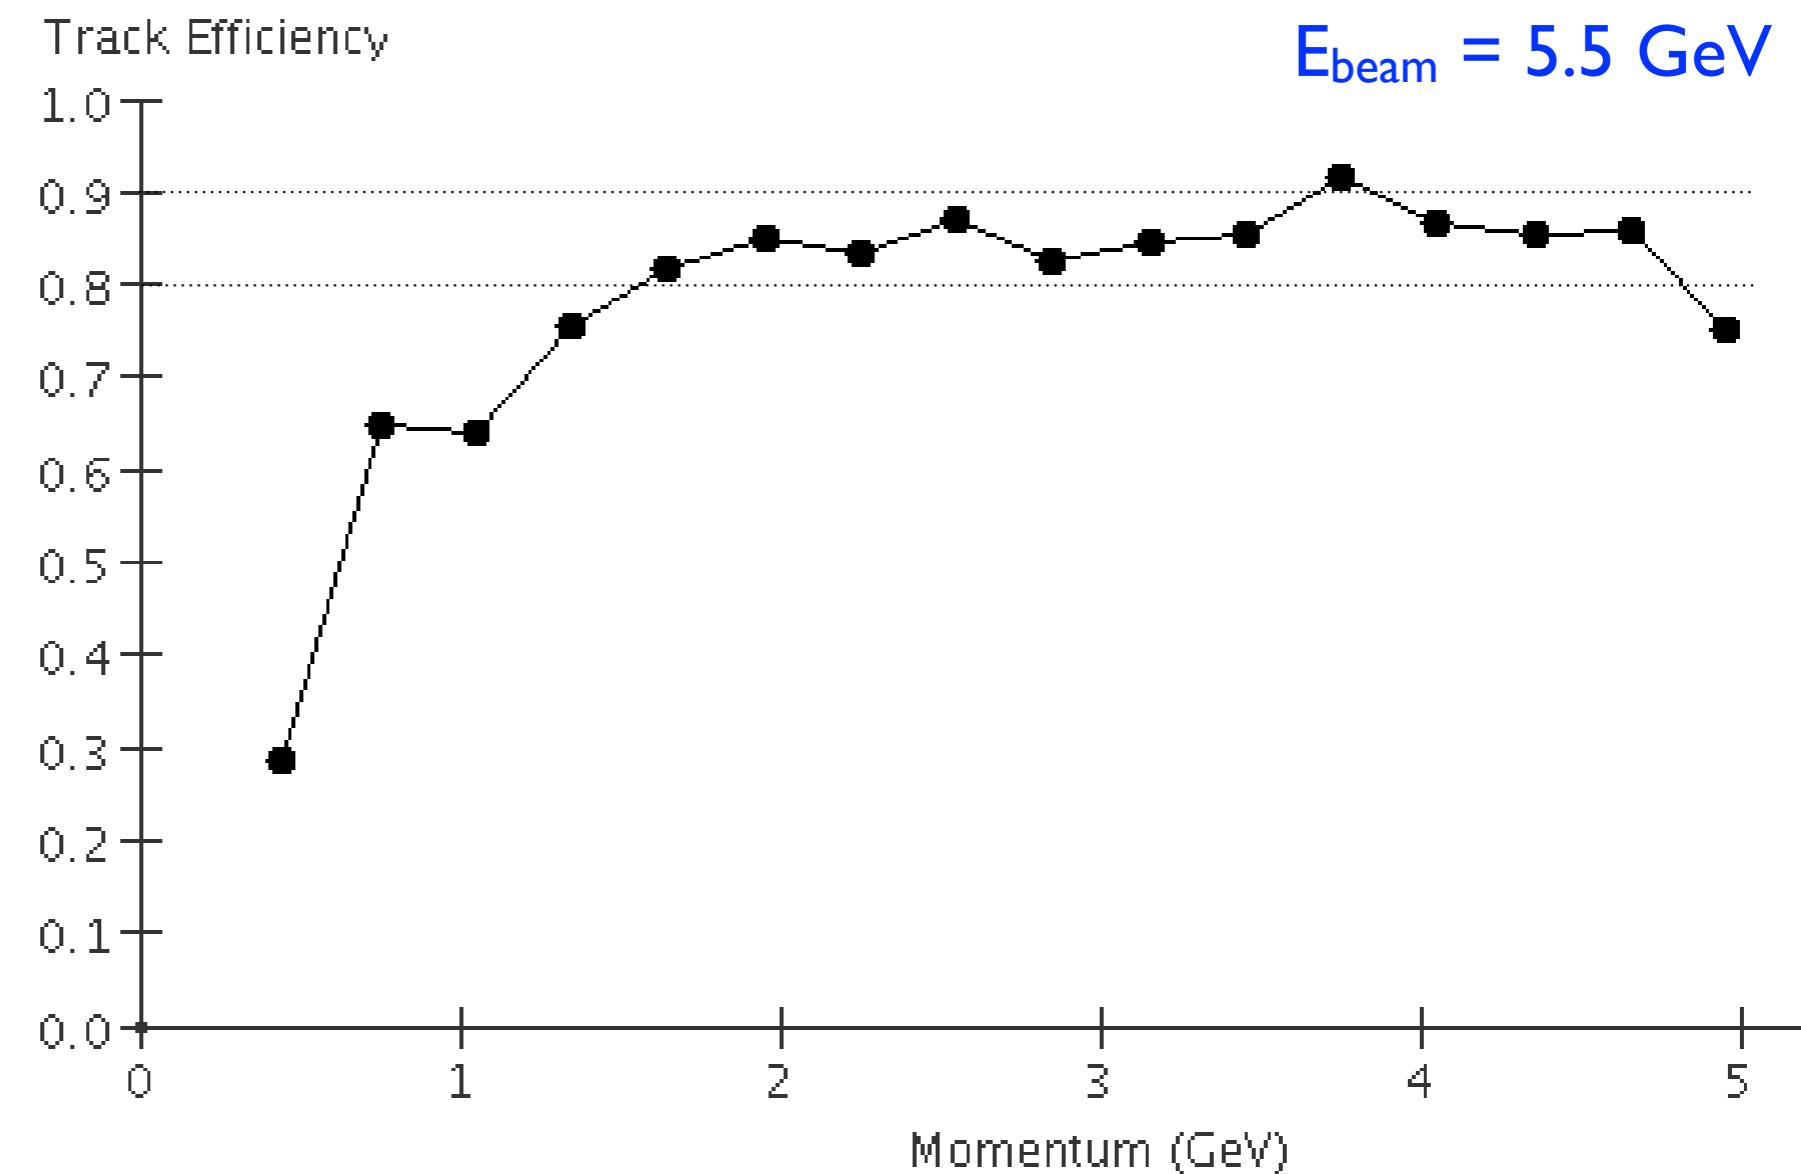

Matt Graham - SLAC

# Tracking Efficiency

after selections

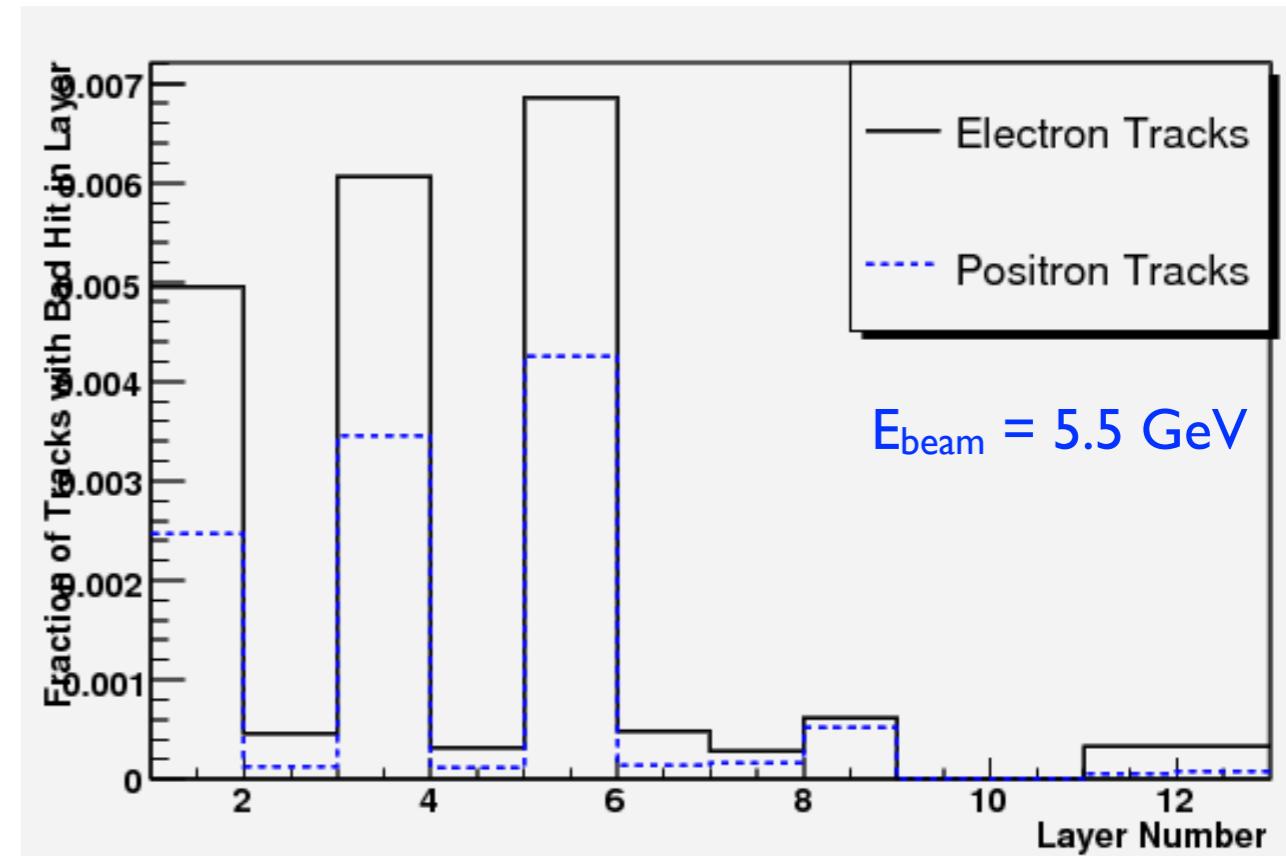

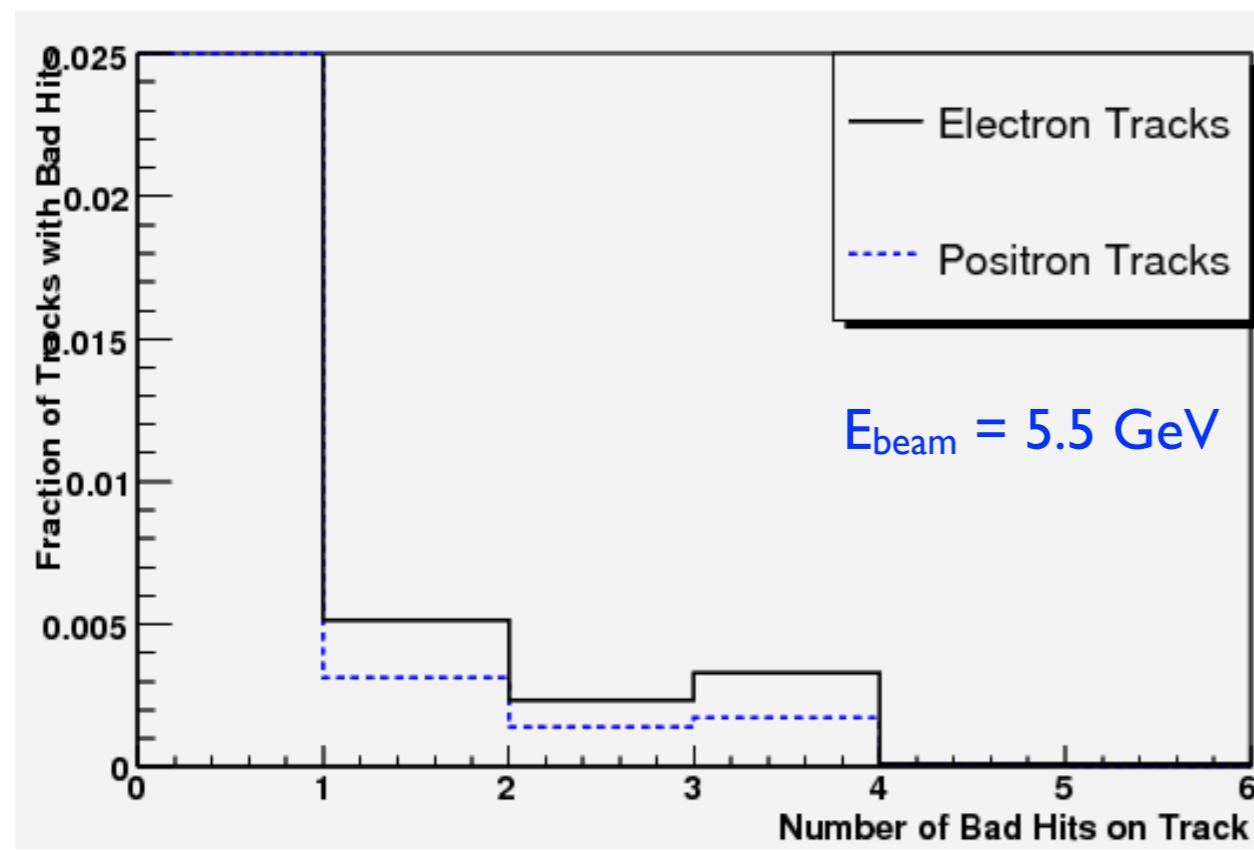

$\chi^2 < 20$

Matt Graham - SLAC

# Tracking Purity

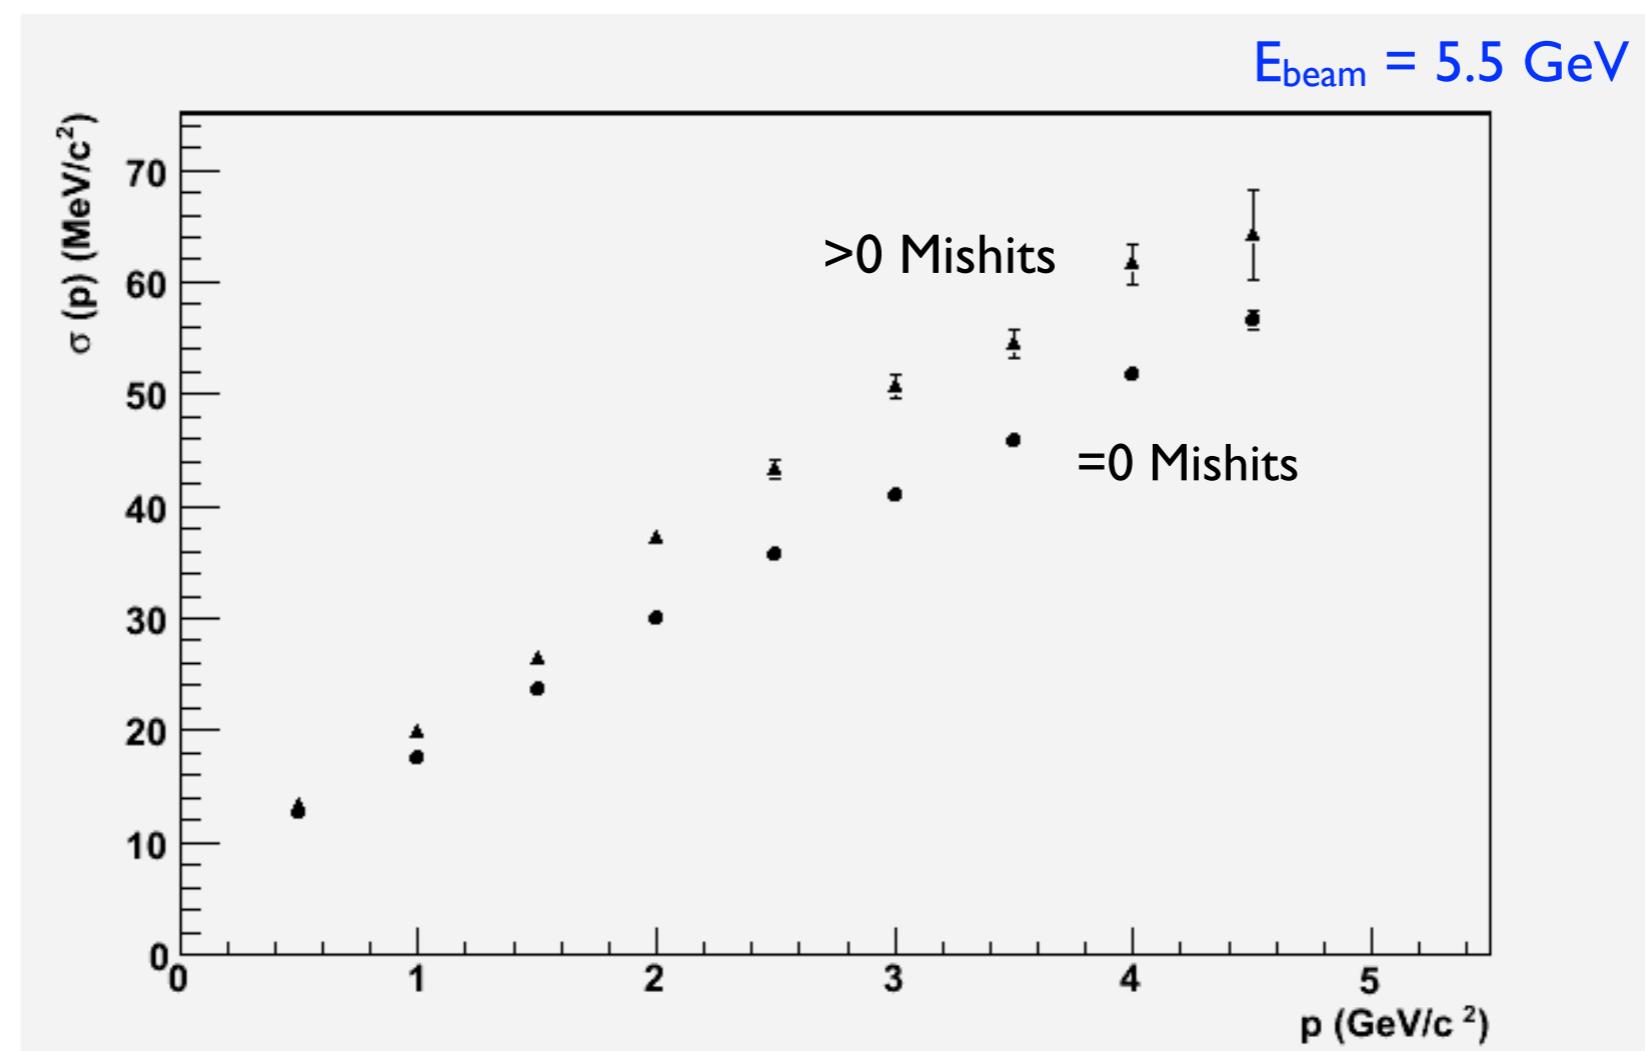

~99% tracks have 12/12 hits assigned correctly

Mis-assigned hits mostly in high-occupancy view of 90-degree stereo layers.

Matt Graham - SLAC

# Momentum Resolution

$$\frac{\sigma_p}{p} \simeq 1 - 1.5\%$$

multiple-scattering dominates errors

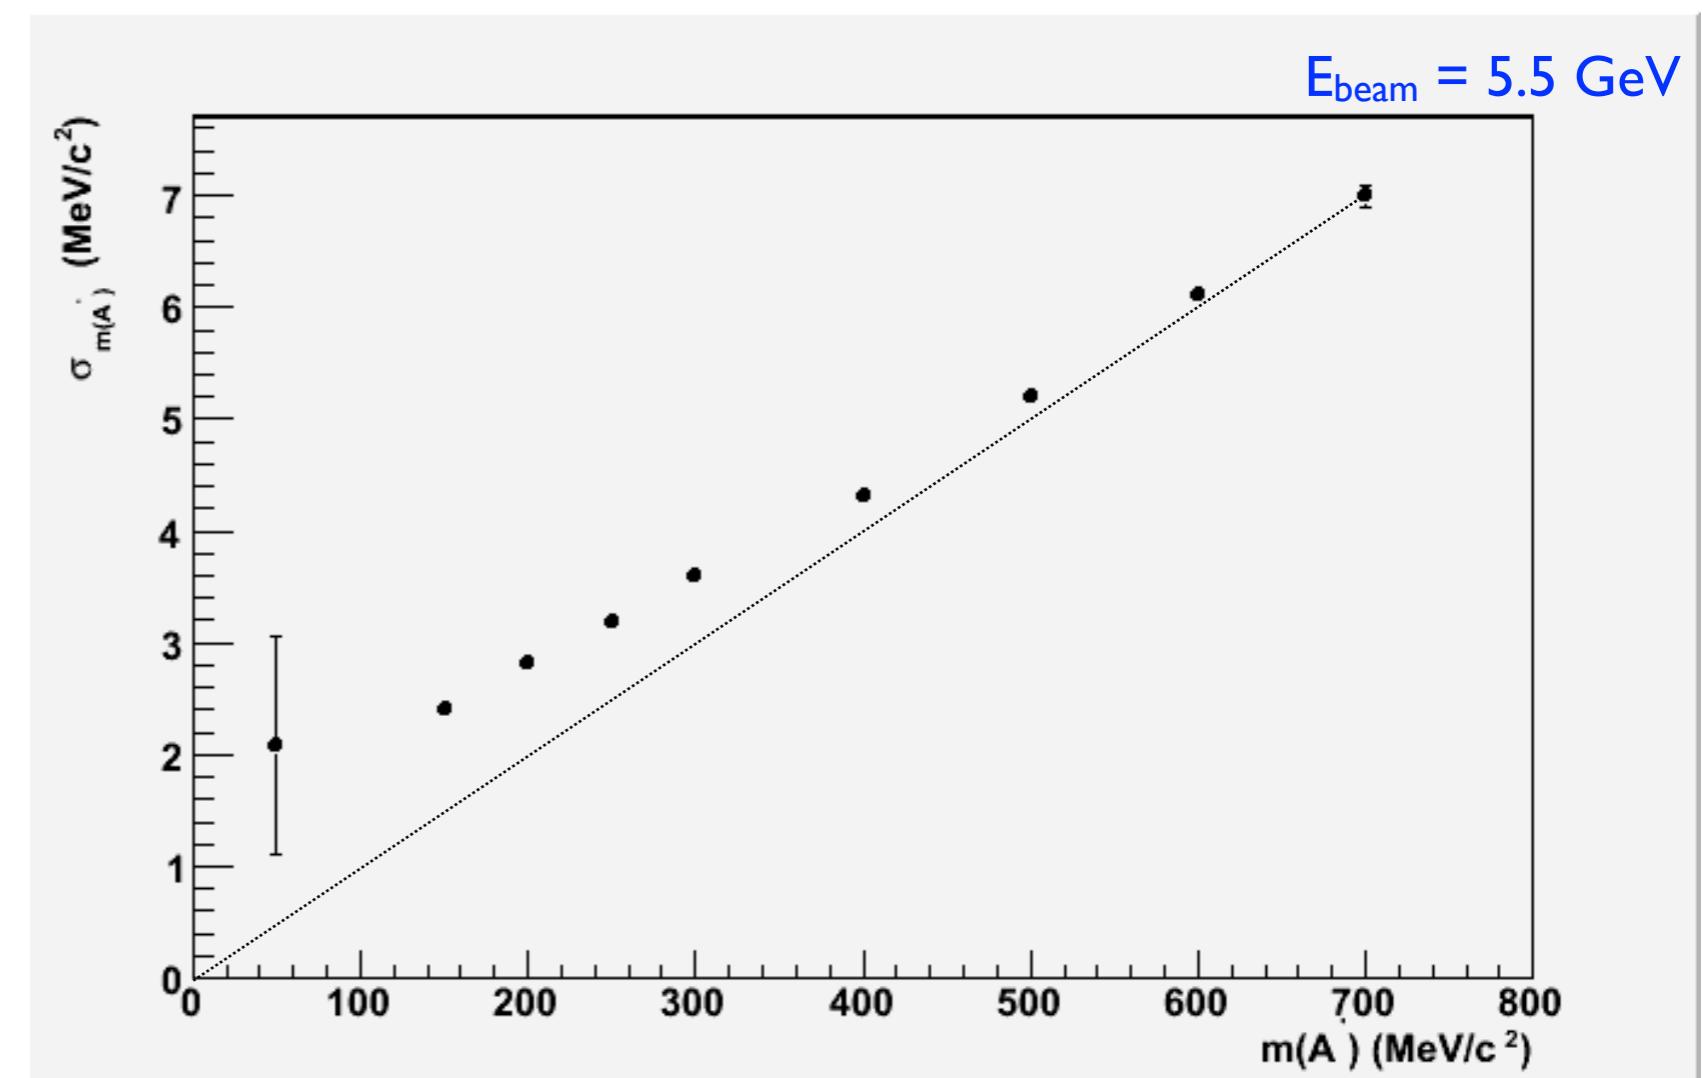

Matt Graham - SLAC

# Mass Resolution

$$\text{naively, } \sigma_m \propto \frac{m}{E}$$

Angular resolution  
at vertex dominates error:  
limited by multiple scattering

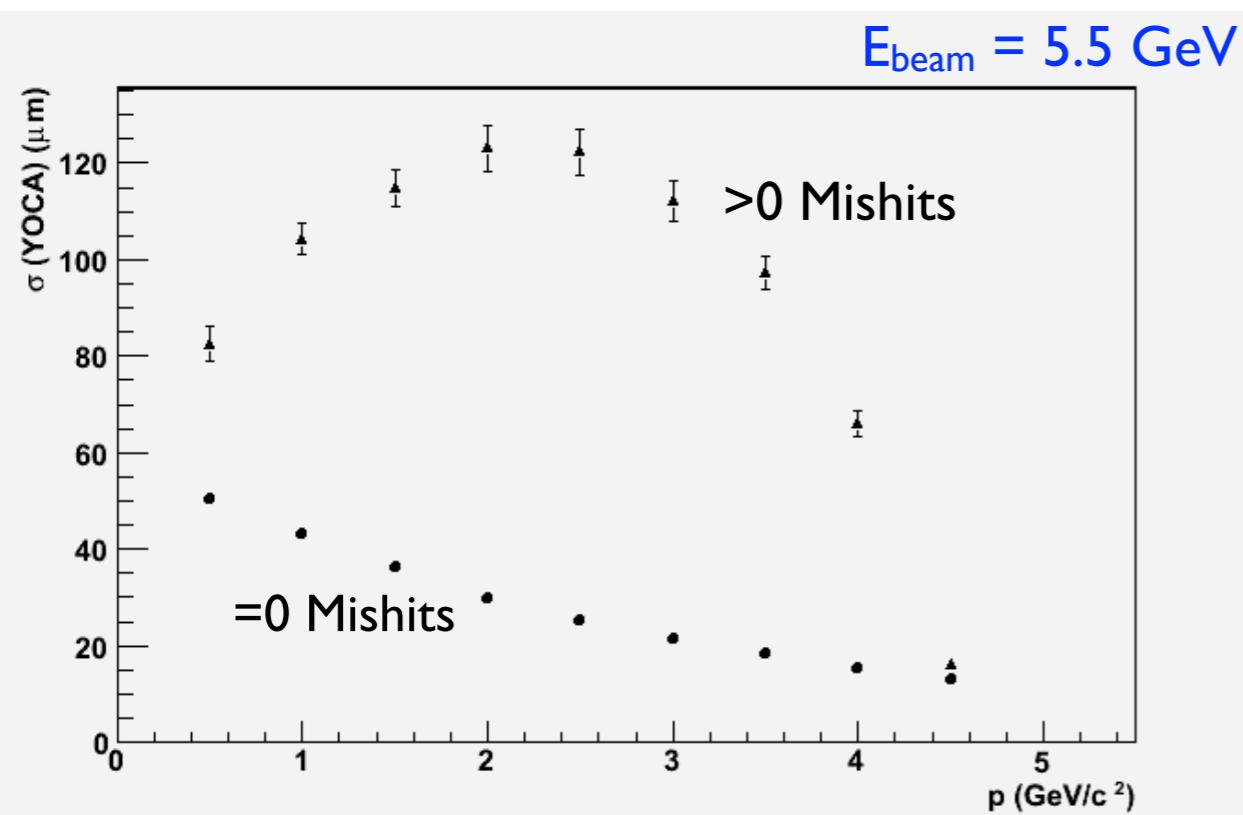

Expect significant  
improvement from  
constraining track to vertex

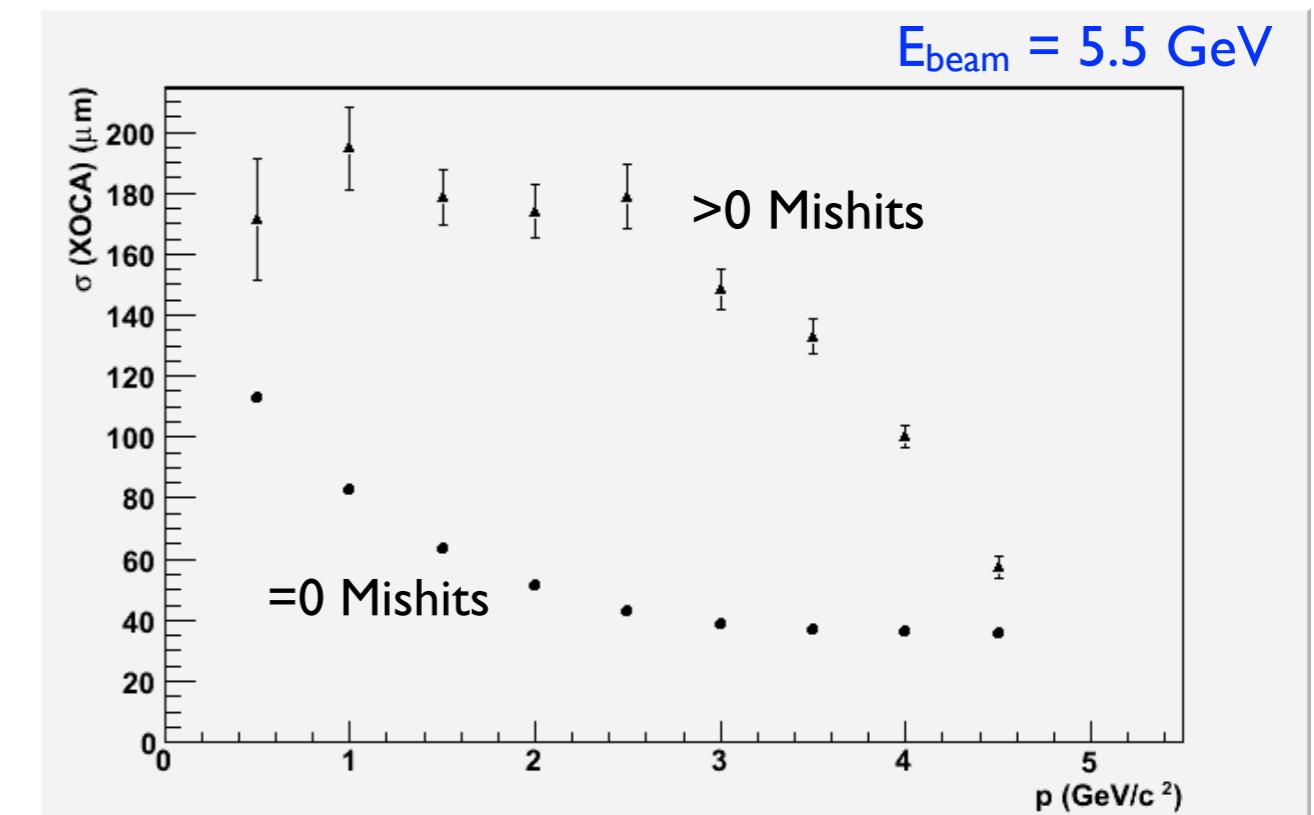

Matt Graham - SLAC

# Impact Parameter Resolution

## Non-Bend Plane

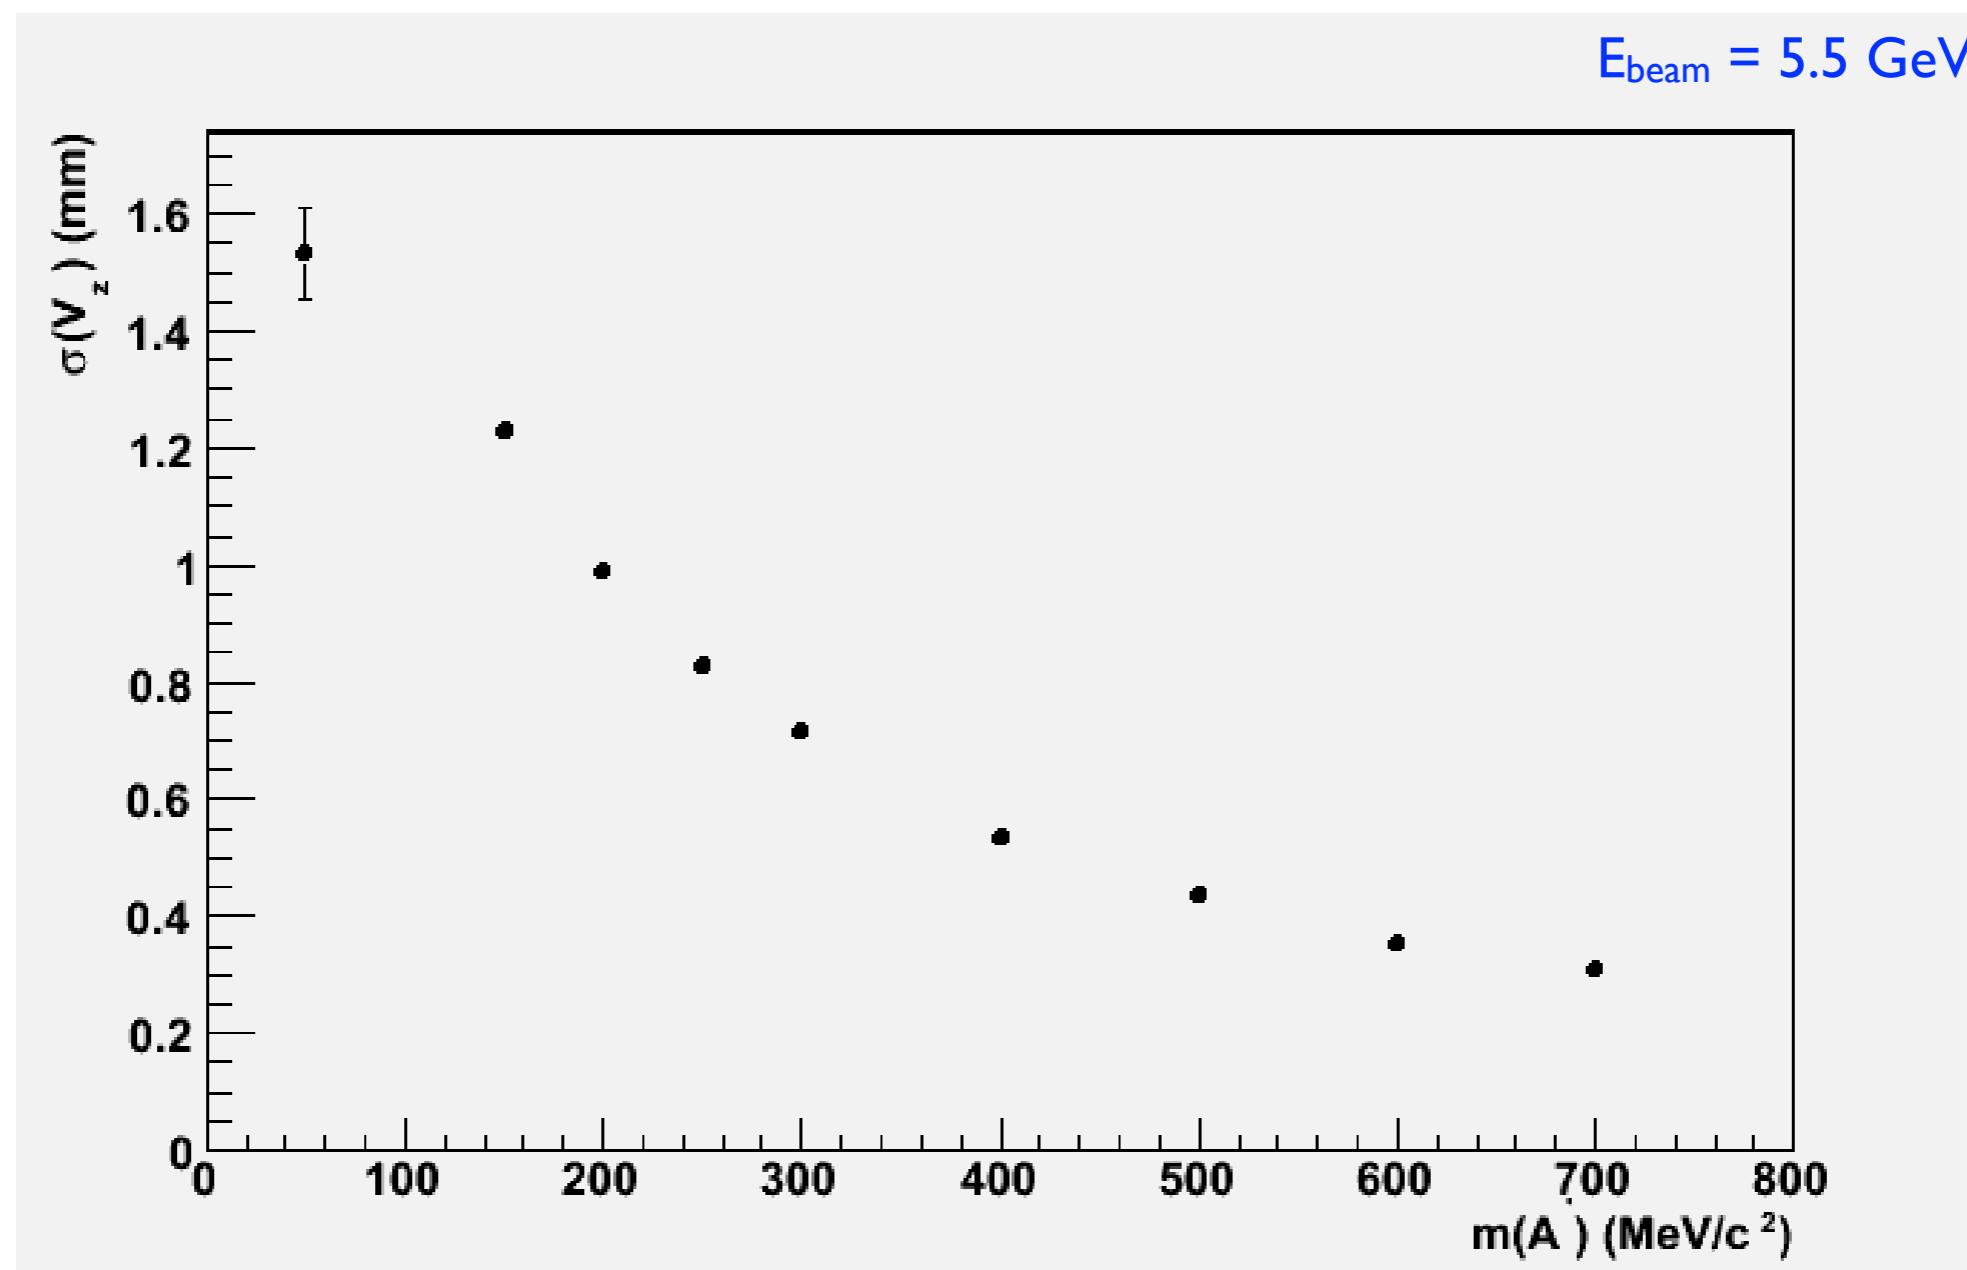

## Bend Plane

Matt Graham - SLAC

# Vertex Resolution

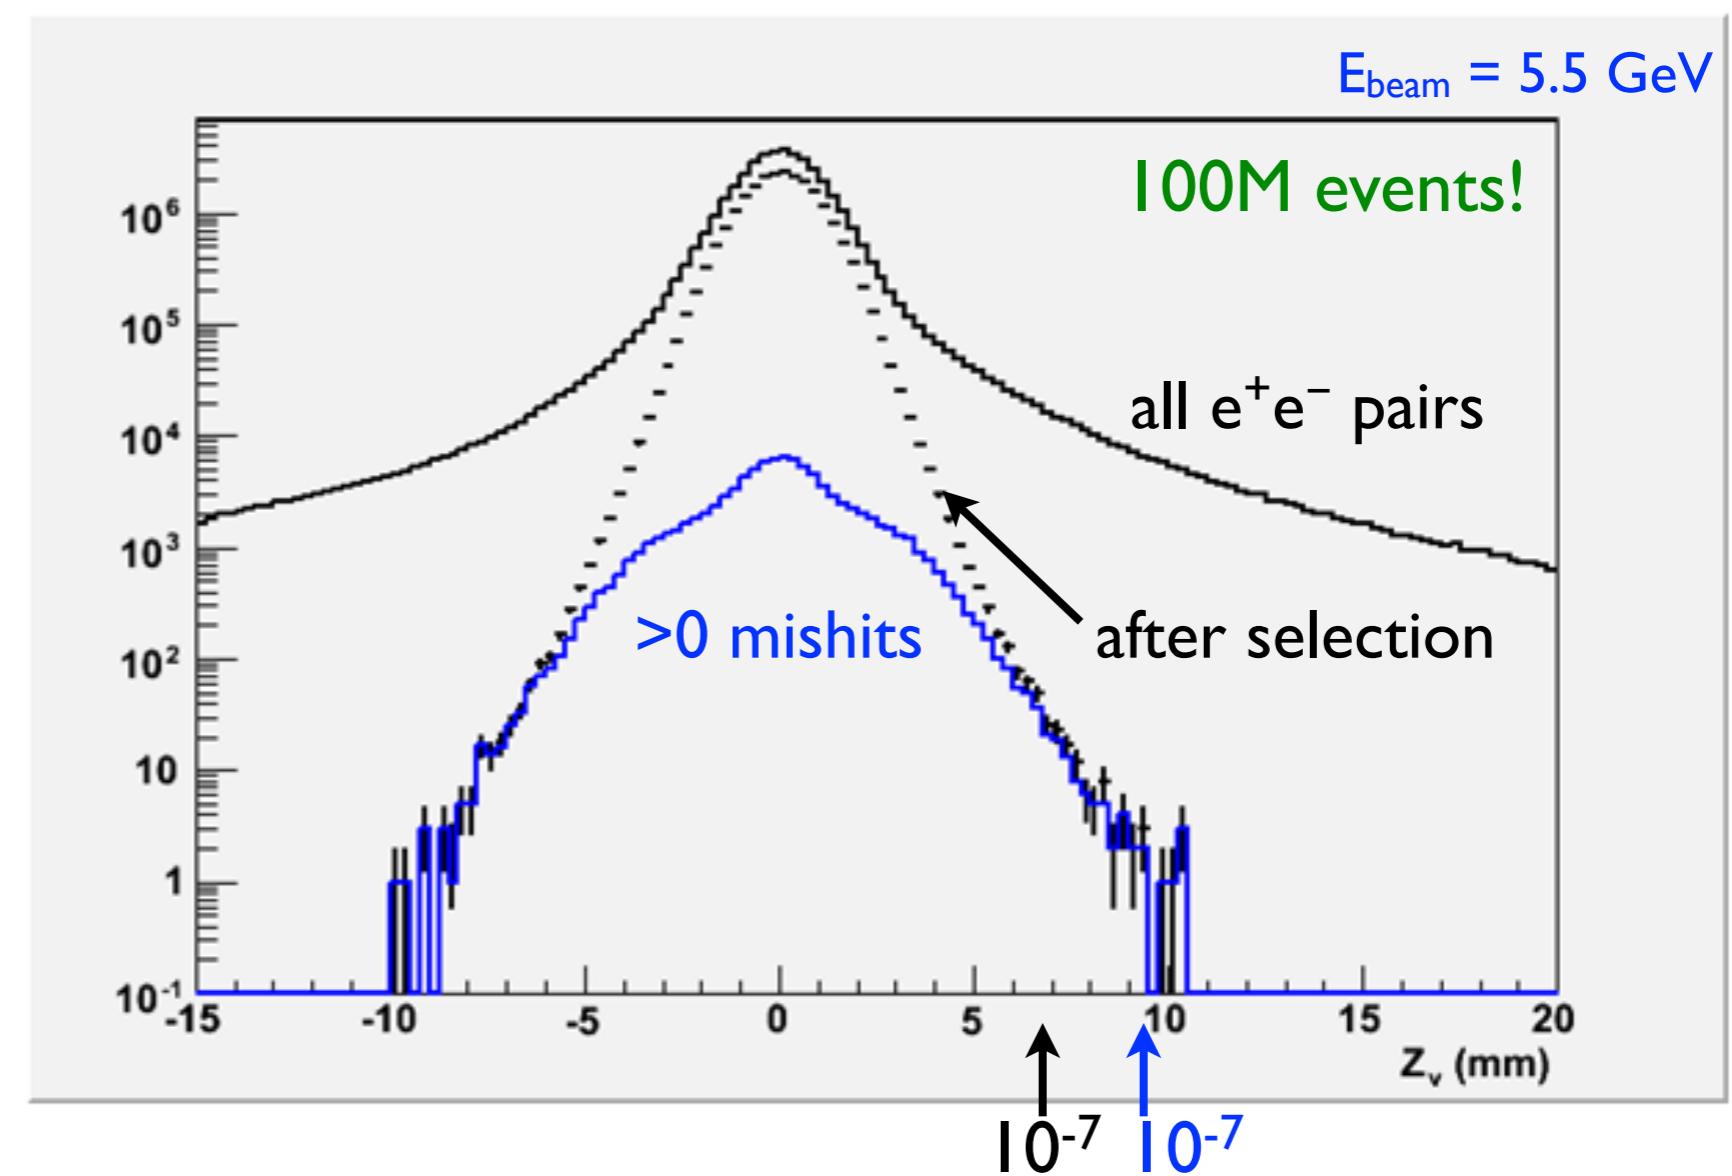

Matt Graham - SLAC

# Prompt Vertex Rejection

need  $\sim 10^{-7}$  rejection for sensitivity to small signals

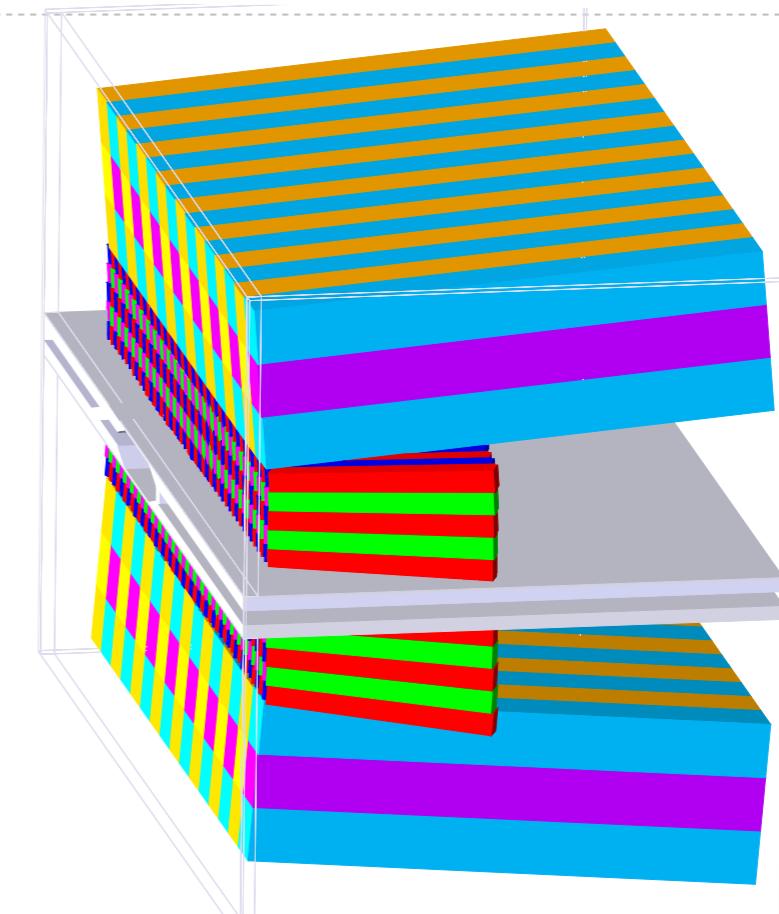

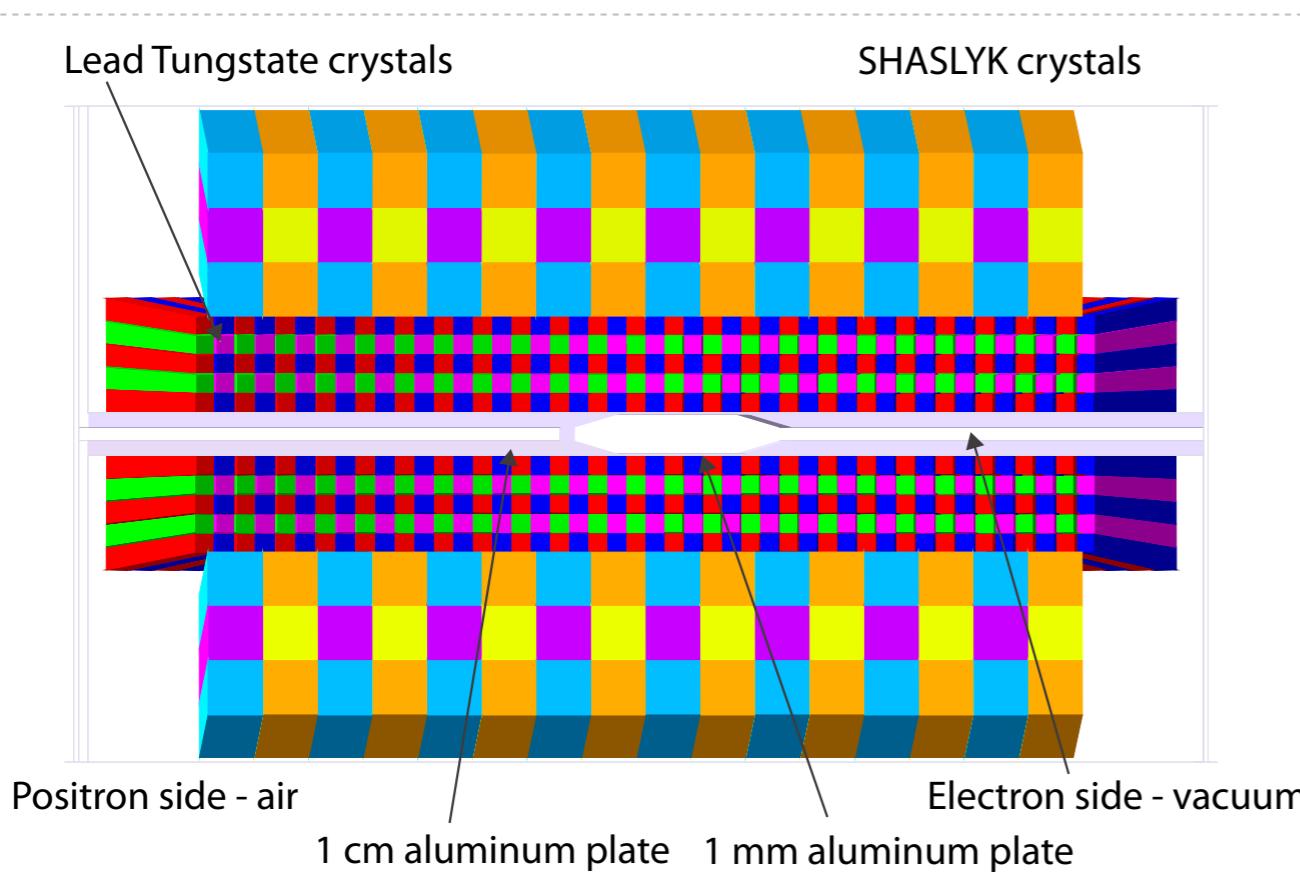

$\chi^2_{\text{track}} < 20$   
 $|p_{A'}| < E_{\text{beam}}$   
 $|v_{x,y}| < 400 \mu\text{m}$   
 $\chi^2_{\text{vertex}} < 15$

Efficiency  $\approx 50\%$

Maurik Holtrop - UNH

# Hybrid Calorimeter

Design criteria: highest acceptance with readily available crystals, low background.

Vacuum box: 1 cm aluminum plate with cutout area for beam.

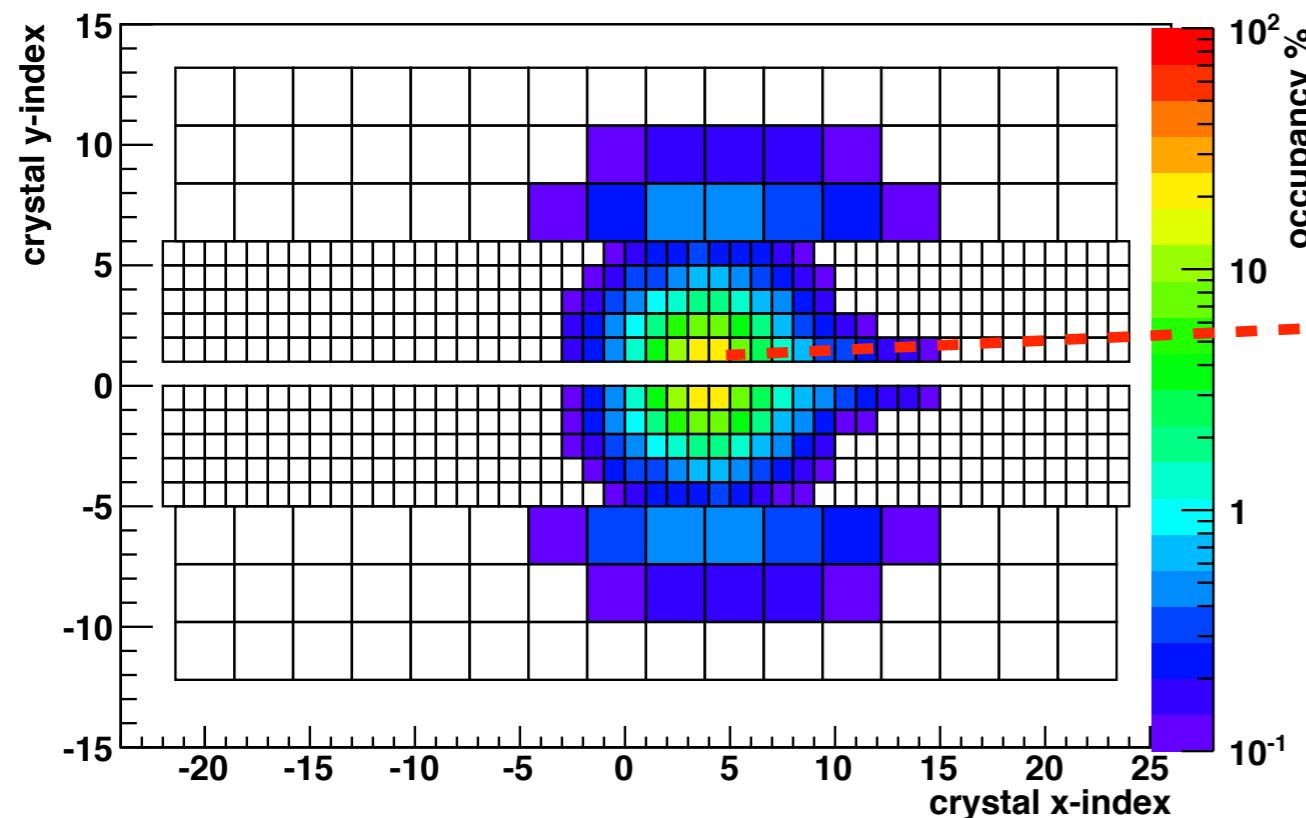

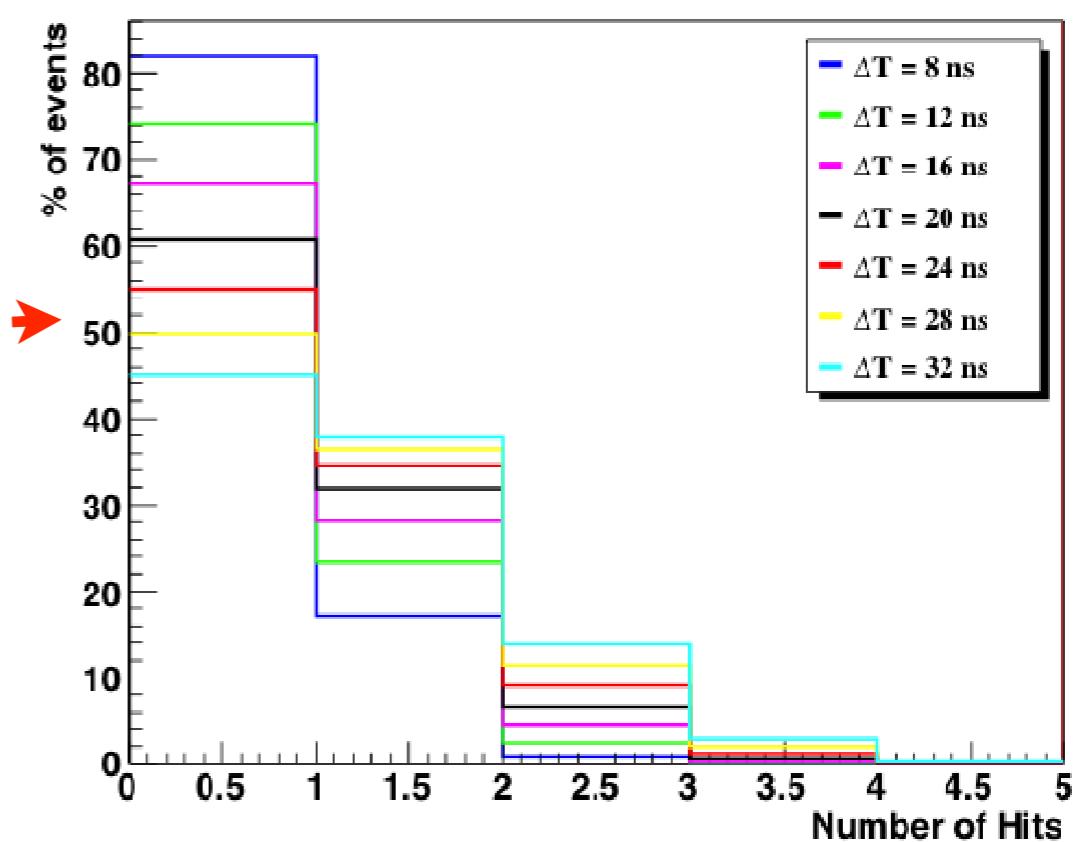

5 rows of 46 lead-tungstate crystals, total: 460

3 rows of 16 lead-glass or Shashlyk crystals, total: 96

In hand from other experiments.

Maurik Holtrop - UNH

# Ecal Occupancy/Multiplicity

Calorimeter Occupancy for threshold = 100 MeV,  $\Delta T = 8$  nsHit Multiplicity for row 1, crystal 4,  $E > 100$  MeV

Acceptable occupancy and multiplicity can be achieved in all crystals with 100 MeV threshold and 8 ns time window.

Maurik Holtrop - UNH

# Trigger Selection

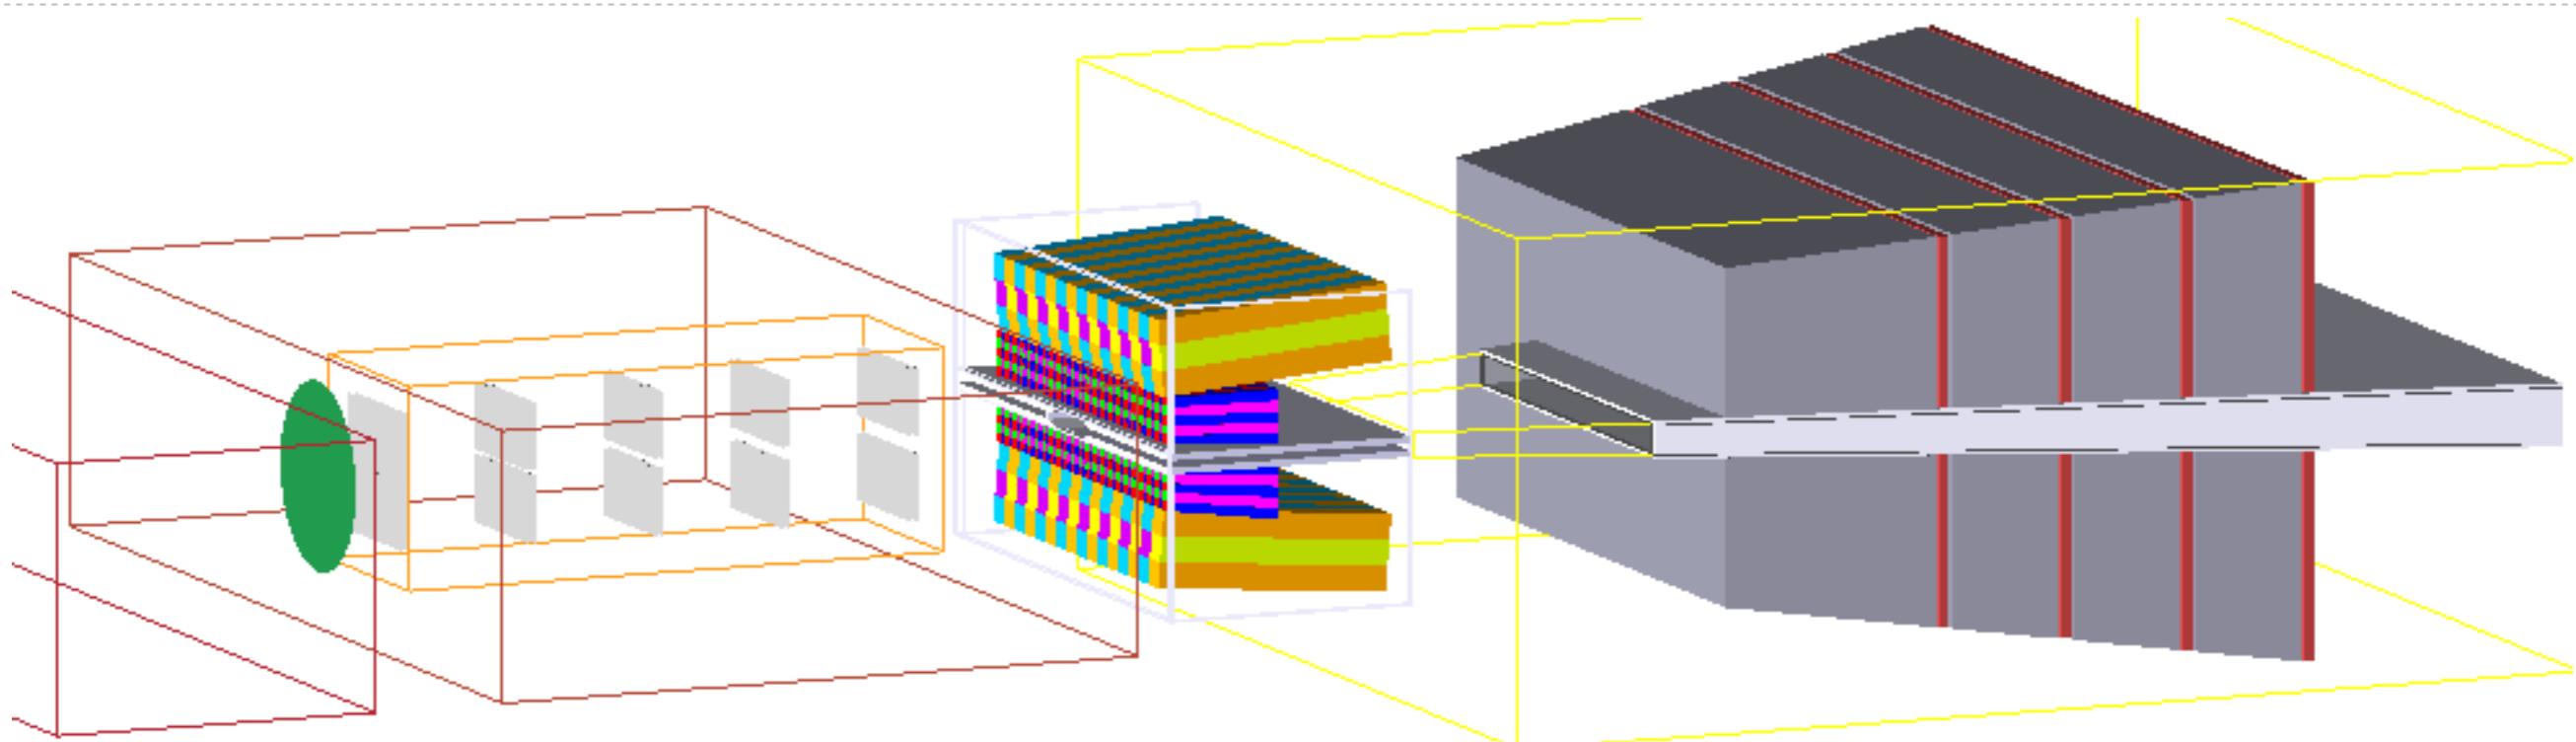

- ◆ Total trigger budget estimated at 20 kHz
- ◆ Simple 3×3 clustering with 50 MeV seed threshold

<b>Trigger Requirement</b>	<b>A' (250 MeV) Acceptance</b>	<b>Background Acceptance</b>	<b>Background Rate</b>
Events with least two opposite clusters	44.6%	1.26%	1.6 MHz
Cluster energy > 0.5 GeV and < 4.4 GeV	46.4 %	0.239%	0.3 MHz
Energy sum < 5.1 GeV	46.4 %	0.0959%	120 kHz
Energy difference < 3.2 GeV	46.1 %	0.0823%	102 kHz
Lower energy - distance slope cut	45.4%	0.0601%	75 kHz
Clusters coplanar to 45°	44.6%	0.0344%	43 kHz
Eliminate crystals in row 1, column 0,3,4	41.3 %	0.0158%	20 kHz
Not counting double triggers	38.1%	0.0135%	17 kHz

<b>A' Mass (MeV)</b>	50	100	200	250	300	400	500	600	700
<b>Trigger Acceptance</b>	3.1%	18.5%	33.7%	38.1%	40.5%	36.3%	30.3%	25.1%	21.3%

# Muon Detector

**Conceptual design:**

**Location ~ 2m from target**

**Iron absorbers: 30 cm + 3x15 cm**

**Four segmented hodoscopes, 1.5 cm thick**

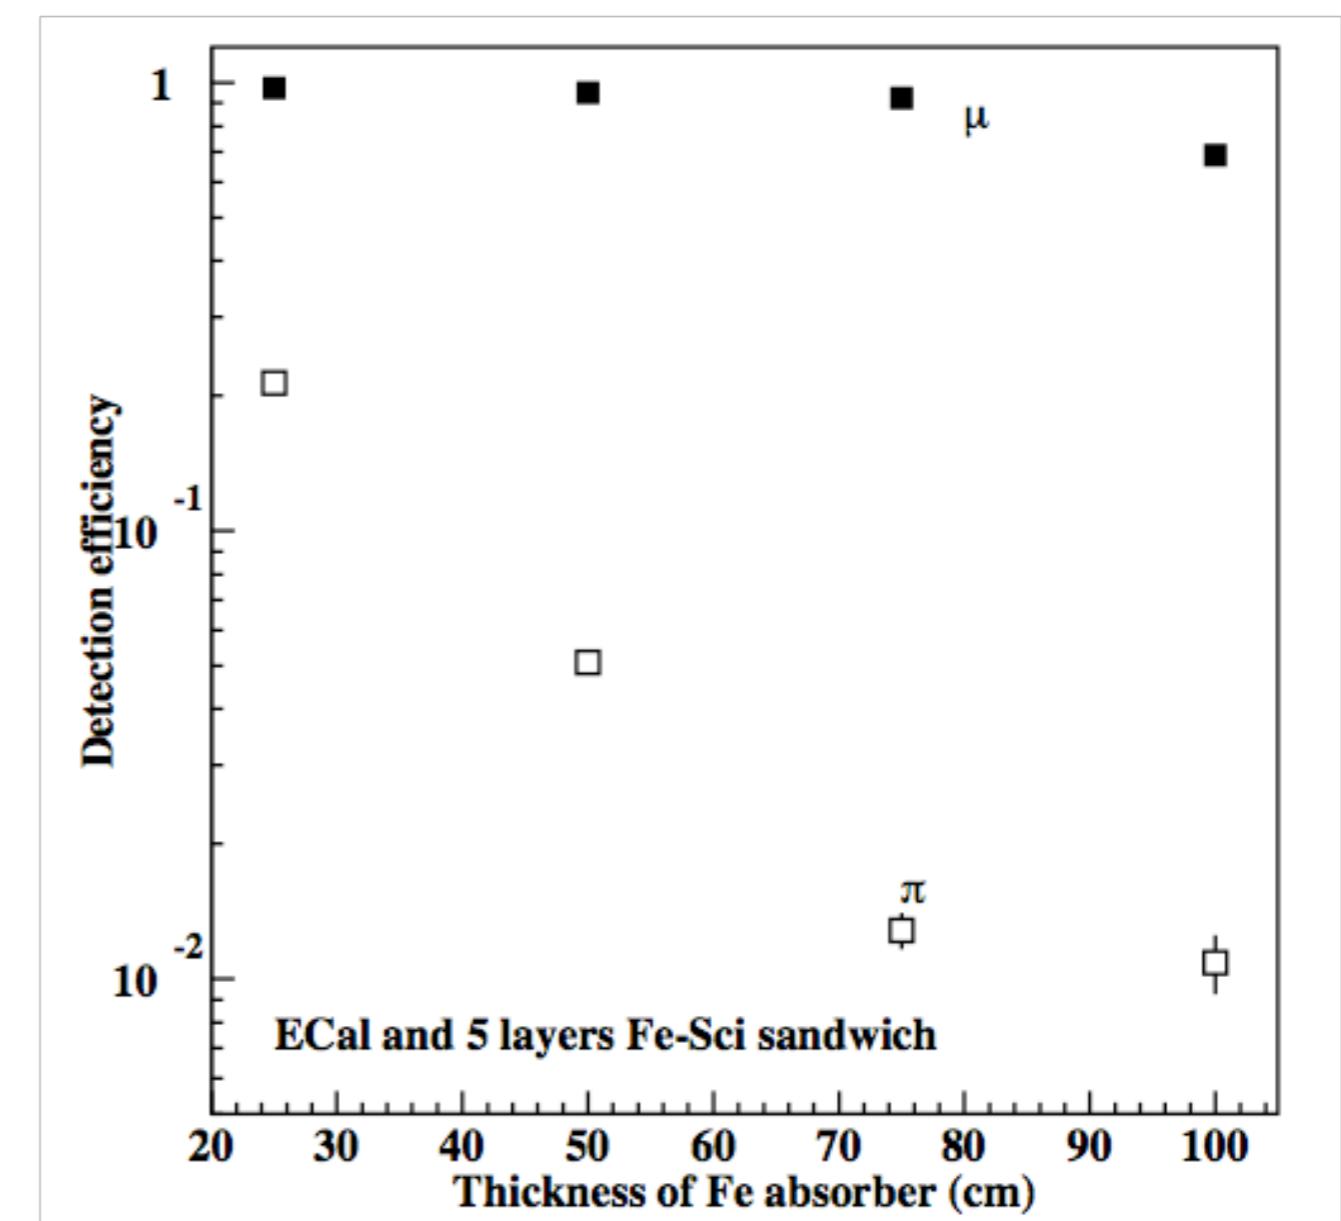

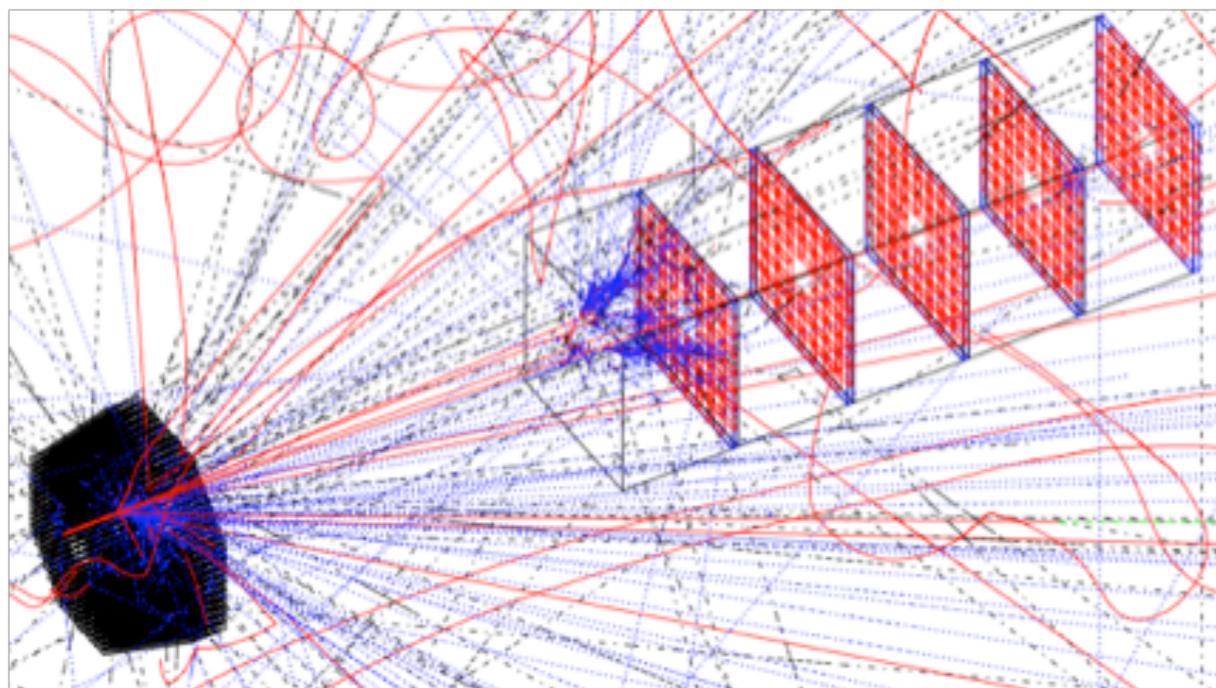

Maurik Holtrop - UNH

# Muon Detector Optimization

In progress:

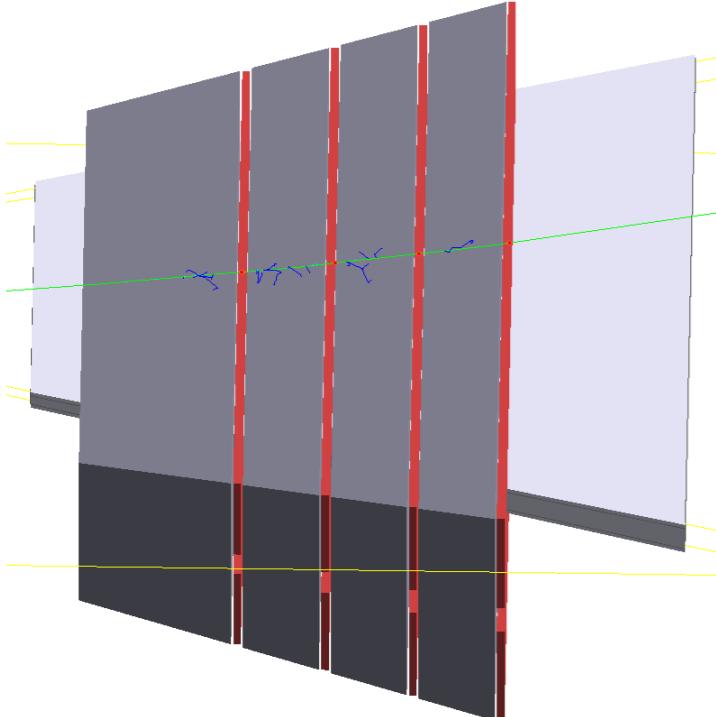

- Est. background trigger rate
- $\approx 250$  Hz (0.1 MeV threshold)
- $\approx < 1$  Hz (0.4 MeV threshold)

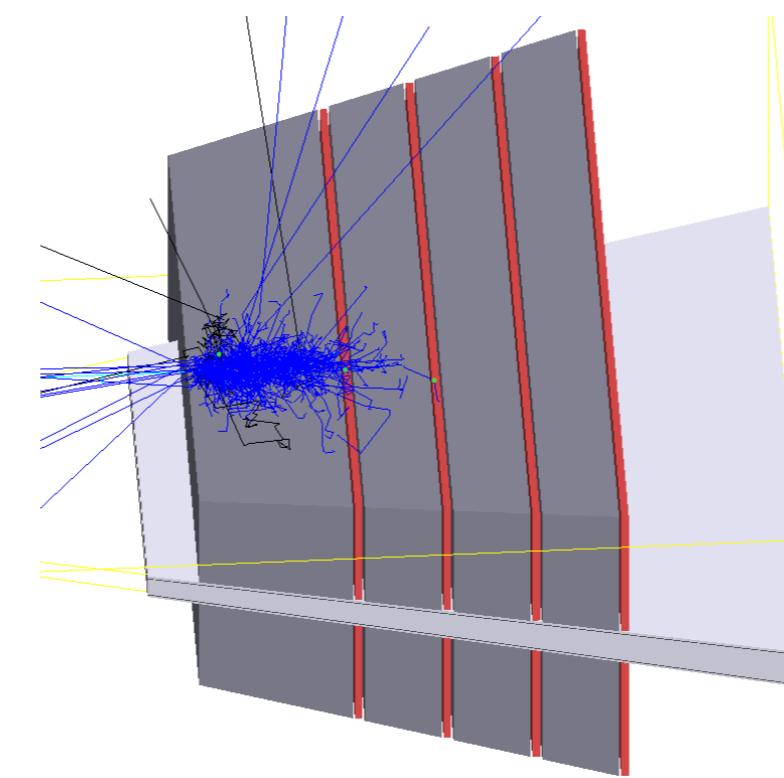

Maurik Holtrop - UNH

# Pions?

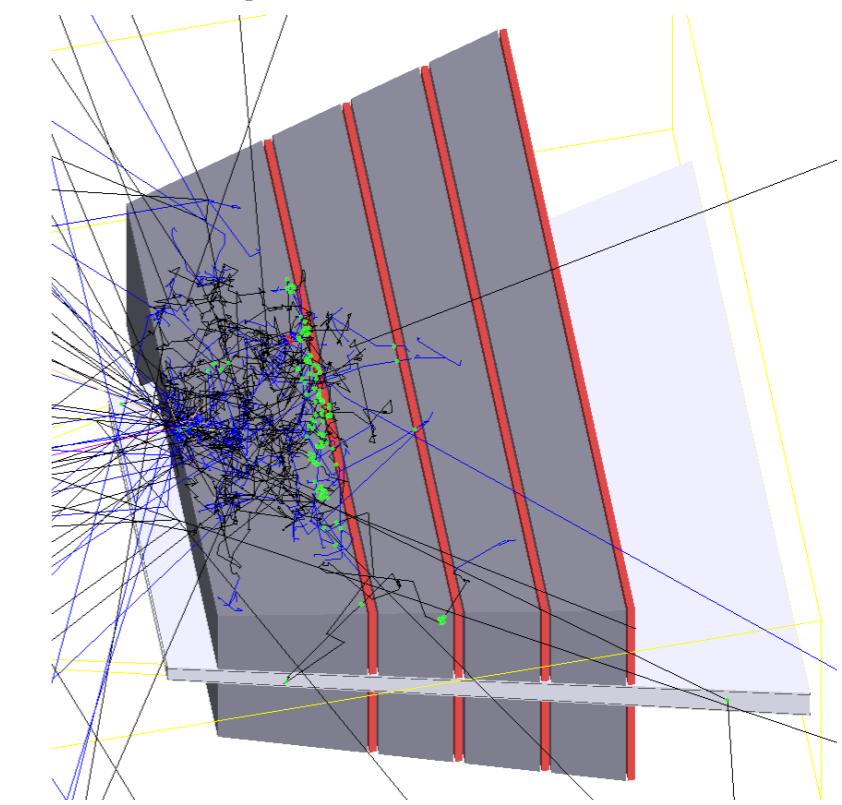

muon

electron

pion

Pion rates lower than predicted? Trigger may be manageable

Add more shallow planes to improve pion trigger/ID?

Phil Schuster - SLAC

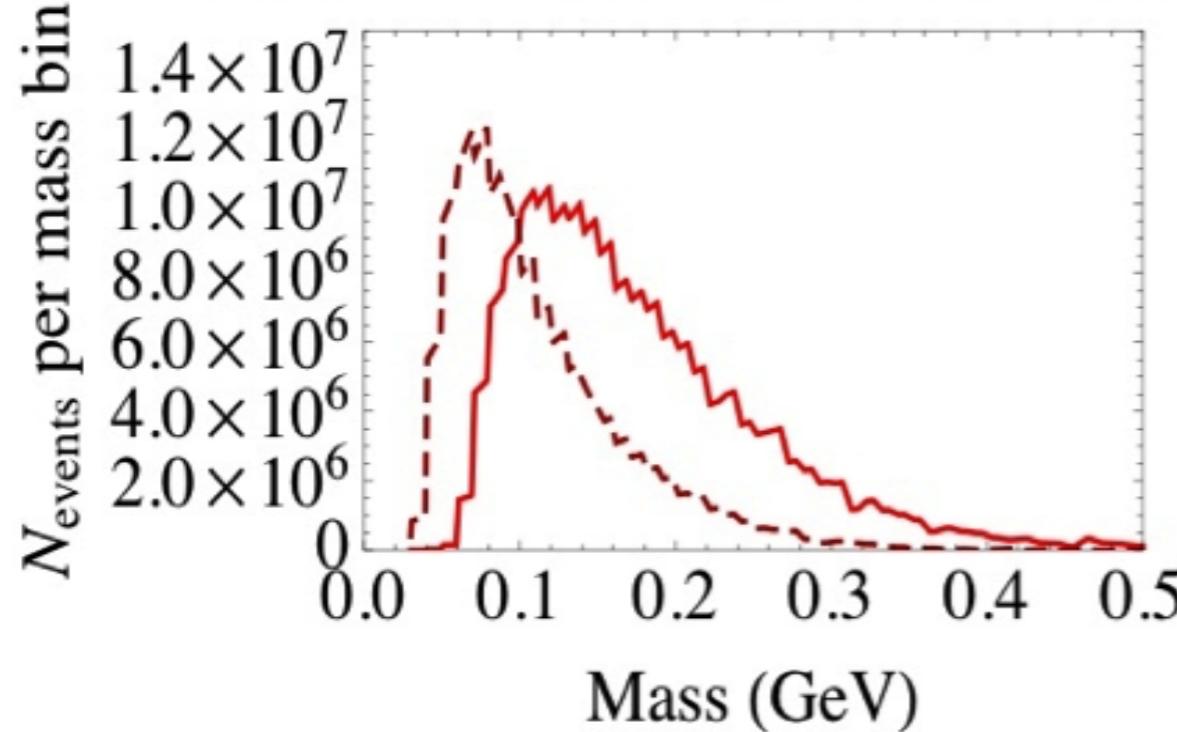

# Reach Estimates

*bump hunt*

$$\frac{d\sigma(e^-Z \rightarrow e^-Z (A' \rightarrow e^+e^-))}{d\sigma(e^-Z \rightarrow e^-Z (\gamma^* \rightarrow e^+e^-))} = \left(\frac{3\pi\epsilon^2}{2 N_{eff} \alpha}\right) \left(\frac{m_{A'}}{\delta m_{A'}}\right)$$

$$\left(\frac{S}{\sqrt{B}}\right)_{bin} = \left(\frac{N_{radiative}}{N_{total}}\right) \sqrt{N_{bin}} \left(\frac{3\pi\epsilon^2}{2 N_{eff} \alpha}\right) \left(\frac{m_{A'}}{\delta m_{A'}}\right) \epsilon_{bin}$$

$E_{beam} = 5.5$  GeV and 3.3 GeV Statistics

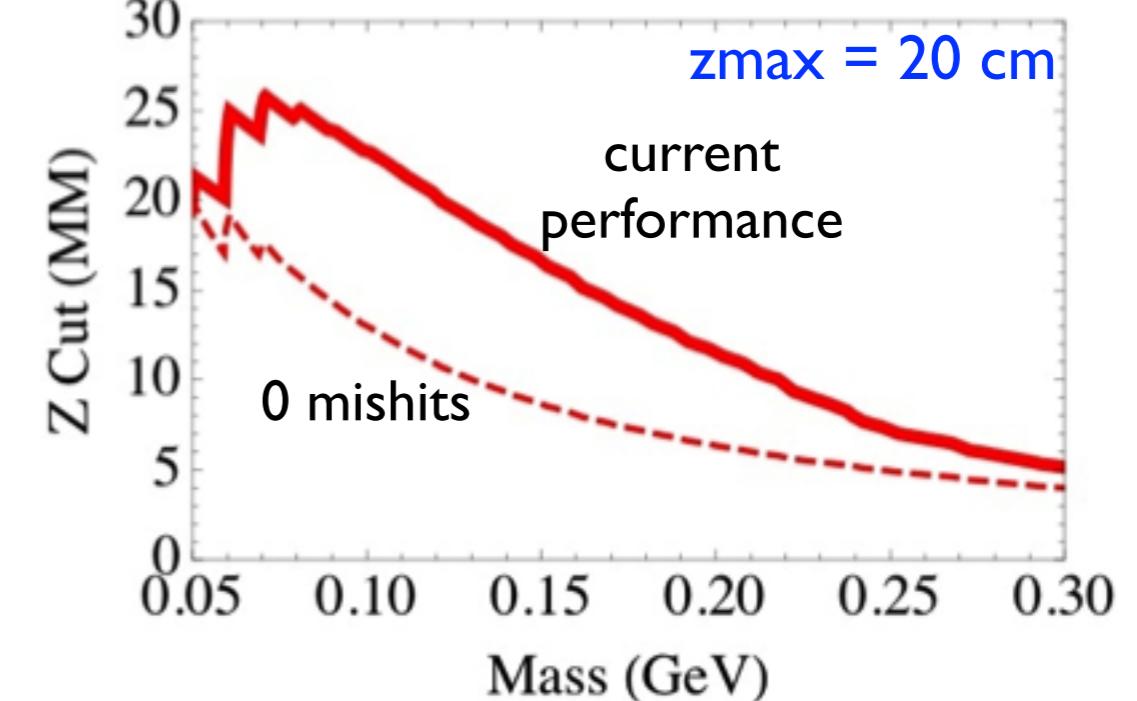

*bump hunt + vertexing*

$$\left(\frac{S}{\sqrt{B}}\right)_{bin,zcut} = \left(\frac{S}{\sqrt{B}}\right)_{bin} \frac{\epsilon_{sigeff}(zcut)}{\sqrt{\epsilon_{rejection}(zcut)}}$$

$$\epsilon_{sigeff}(zcut) \cong \epsilon_{vtx} \times \left( e^{-\left(\frac{zcut}{\gamma c \tau}\right)} - e^{-\left(\frac{zmax}{\gamma c \tau}\right)} \right)$$

$E_{beam} = 5.5$  GeV Signal Region Vertex Cut

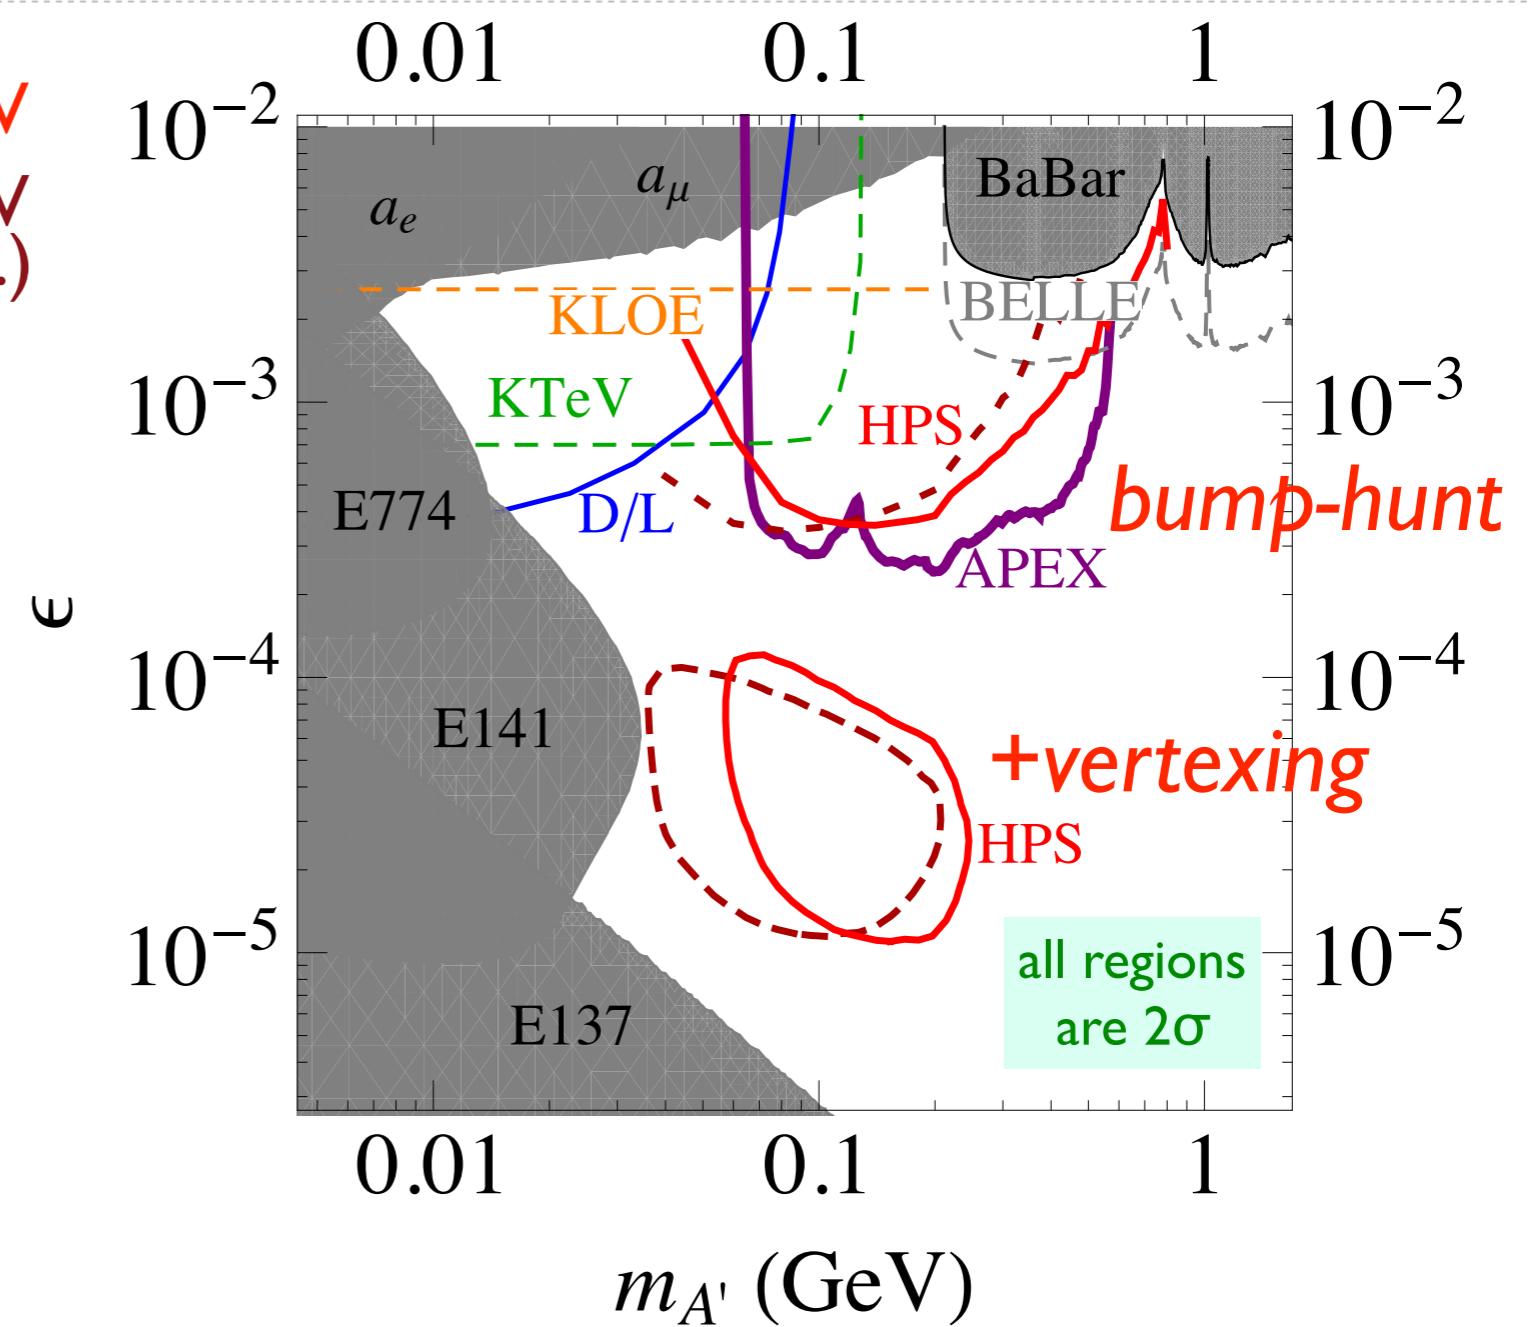

Phil Schuster - SLAC

# HPS Reach: one month run

$E_{\text{beam}} = 5.5 \text{ (3.3) GeV}$       — 5.5 GeV  
 $I_{\text{beam}} = 400 \text{nA}$       - - - 3.3 GeV (prelim.)  
 Target = 0.25% (0.125%) W  
 Time =  $3 \times 10^6 \text{ s} (\sim 1 \text{ month})$

**APEX:** “A-prime Experiment”  
 $m(e^+e^-)$  bump-hunt using  
 Hall A two-arm spectrometer.

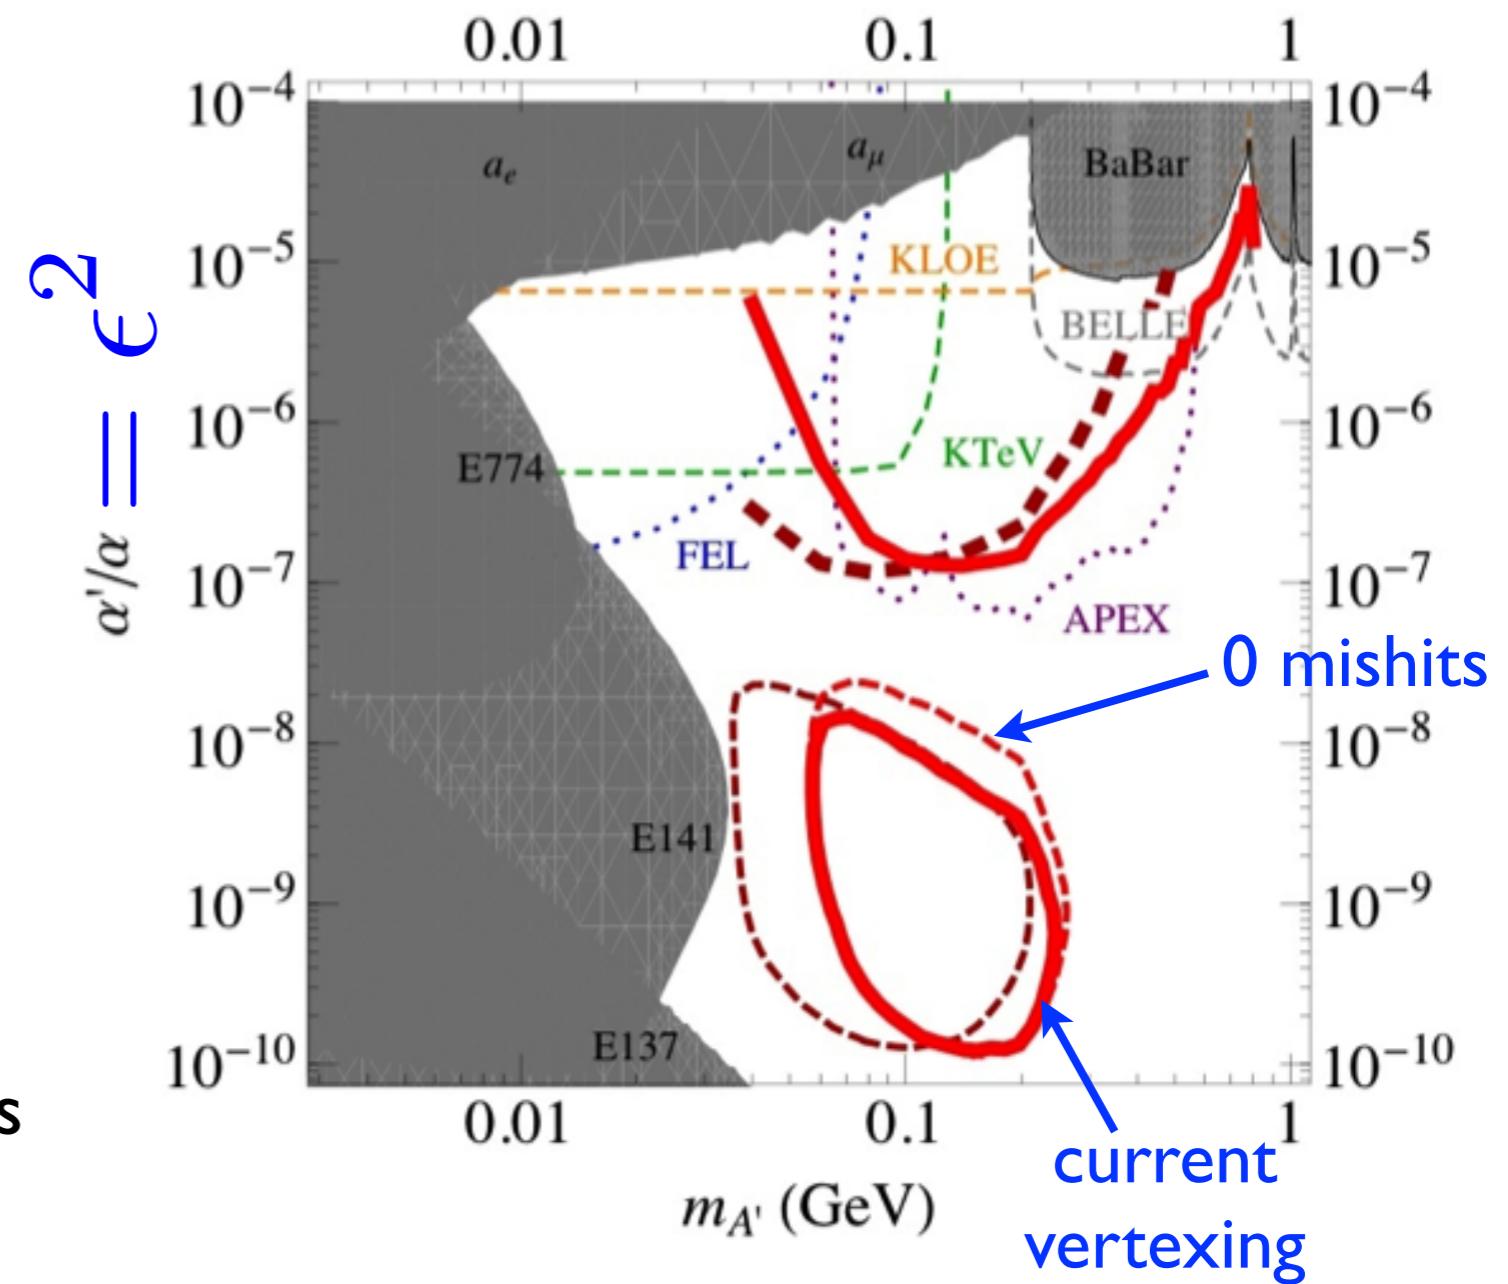

**D/L:** DarkLight:  
 full kinematic reconstruction  
 using JLab FEL and H-gas target

Phil Schuster - SLAC

# Expected Improvements

- Further elimination of tracks with mishits
- Vertex-constrained mass
- Likelihood fit to decay length distributions
- Optimization of muons, addition of pions
- Addition of more beam energies

# Status

- ⬢ Proposal presented at JLab workshop “Boson 2010”  
<http://conferences.jlab.org/boson2010/>
- ⬢ Estimated cost: \$3.1M (includes contingency)
- ⬢ No time “on the floor” in the 6GeV schedule:  
main run period likely to be in 12 GeV era.
- ⬢ Going before PAC at JLab in January
- ⬢ Pulling up the sofa cushions to continue development work

# Plans

- Testing reach at 12GeV energies
- Investigating alternate magnets
- Hard at work on the targets that will be needed
- Broadening trigger and reach to include pions, optimize muons
- Tracking/vertexing improvements
- APV25 readout and DAQ development getting underway

# Summary

- ⬢ Compelling reasons to look for a hidden, low-mass U(1)
- ⬢ JLab has two excellent instruments for these searches:  
CEBAF and FEL
- ⬢ HPS has unique capability to probe intermediate couplings:  
complimentary to other efforts
- ⬢ Interesting reach already demonstrated:  
*how much better can we make it?*

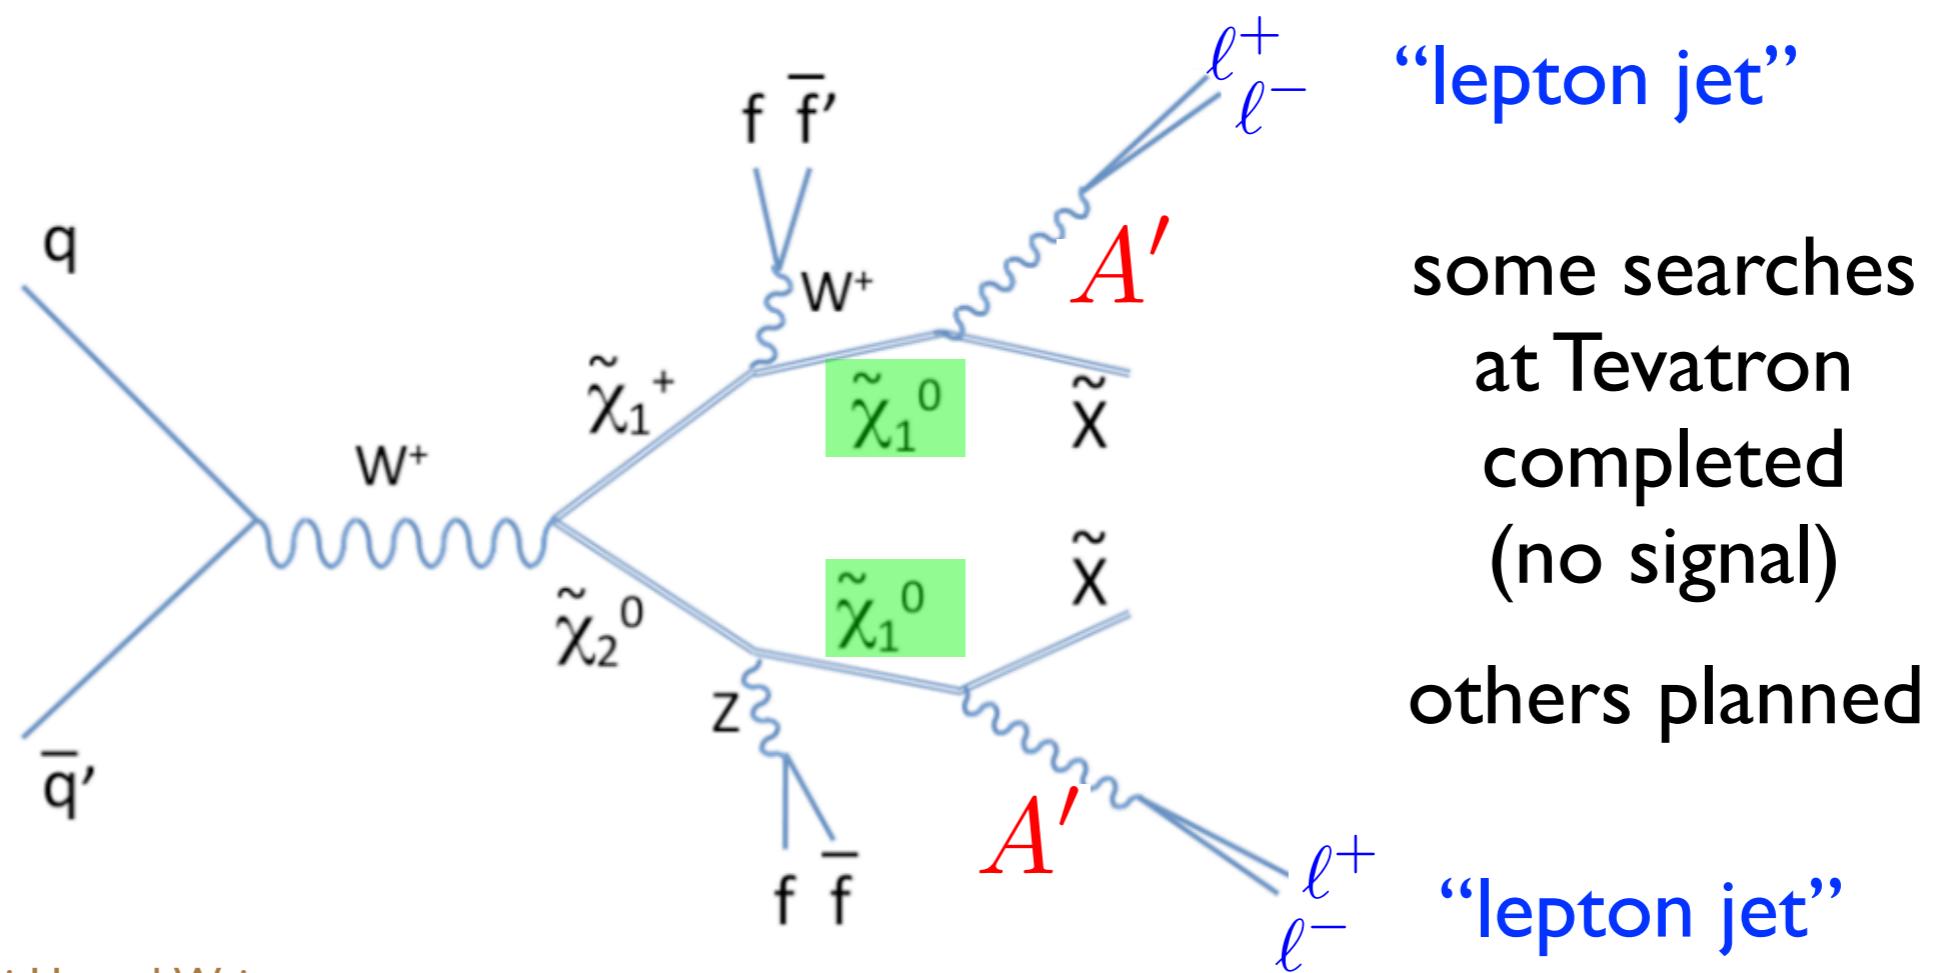

# Backup Slides

# Direct Searches: Tevatron/LHC

Lightest SUSY particle (“LSP”) not stable,  
and can decay to  $A'$  + hidden sector

Arkani-Hamed, Weiner

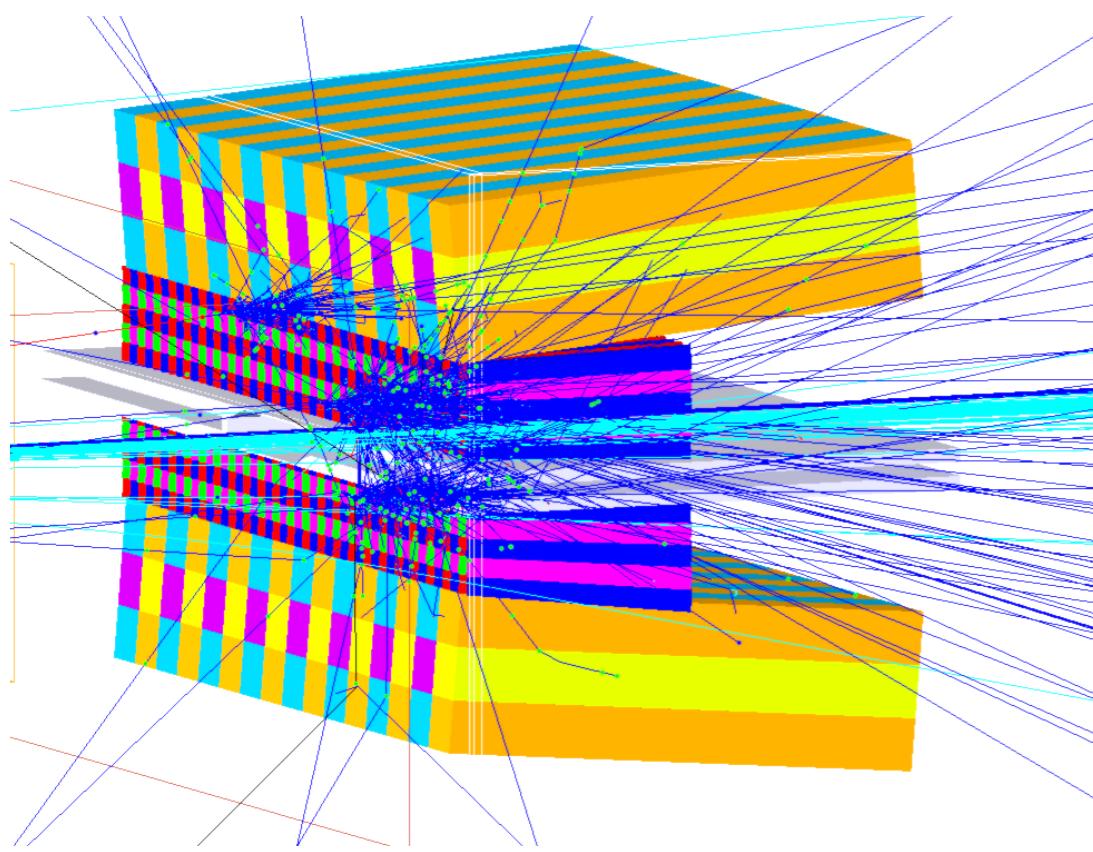

Bumgart, Cheung, Ruderman, Wang, Yavin

D-zero, arXiv: 1008.3356

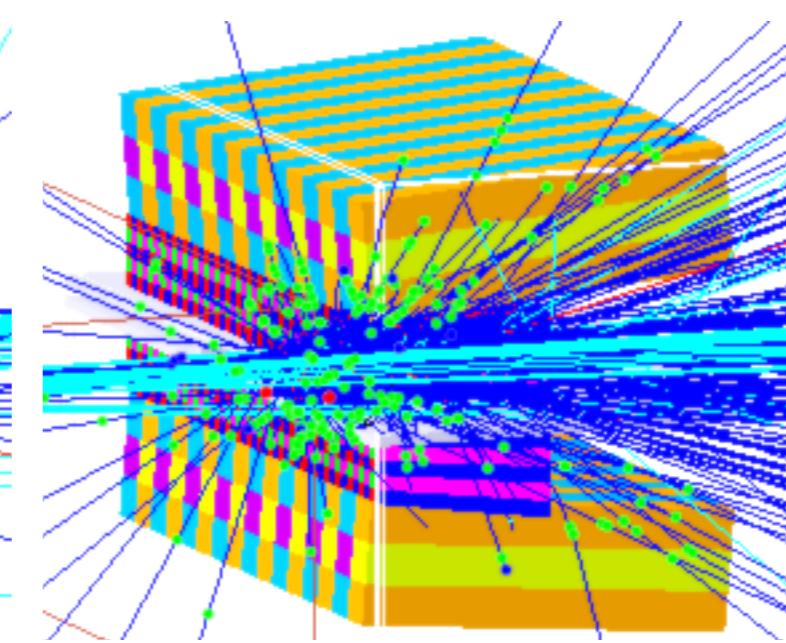

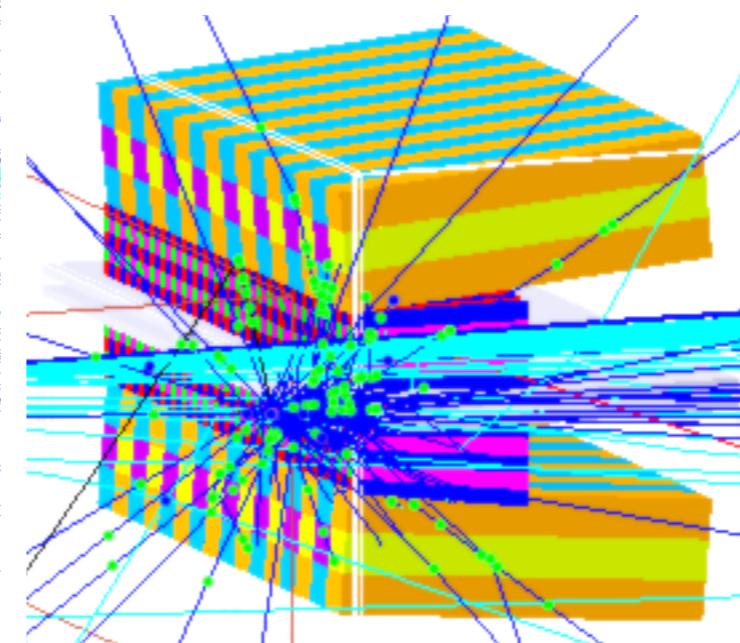

Maurik Holtrop - UNH

# Ecal Trigger

250 MeV A' event

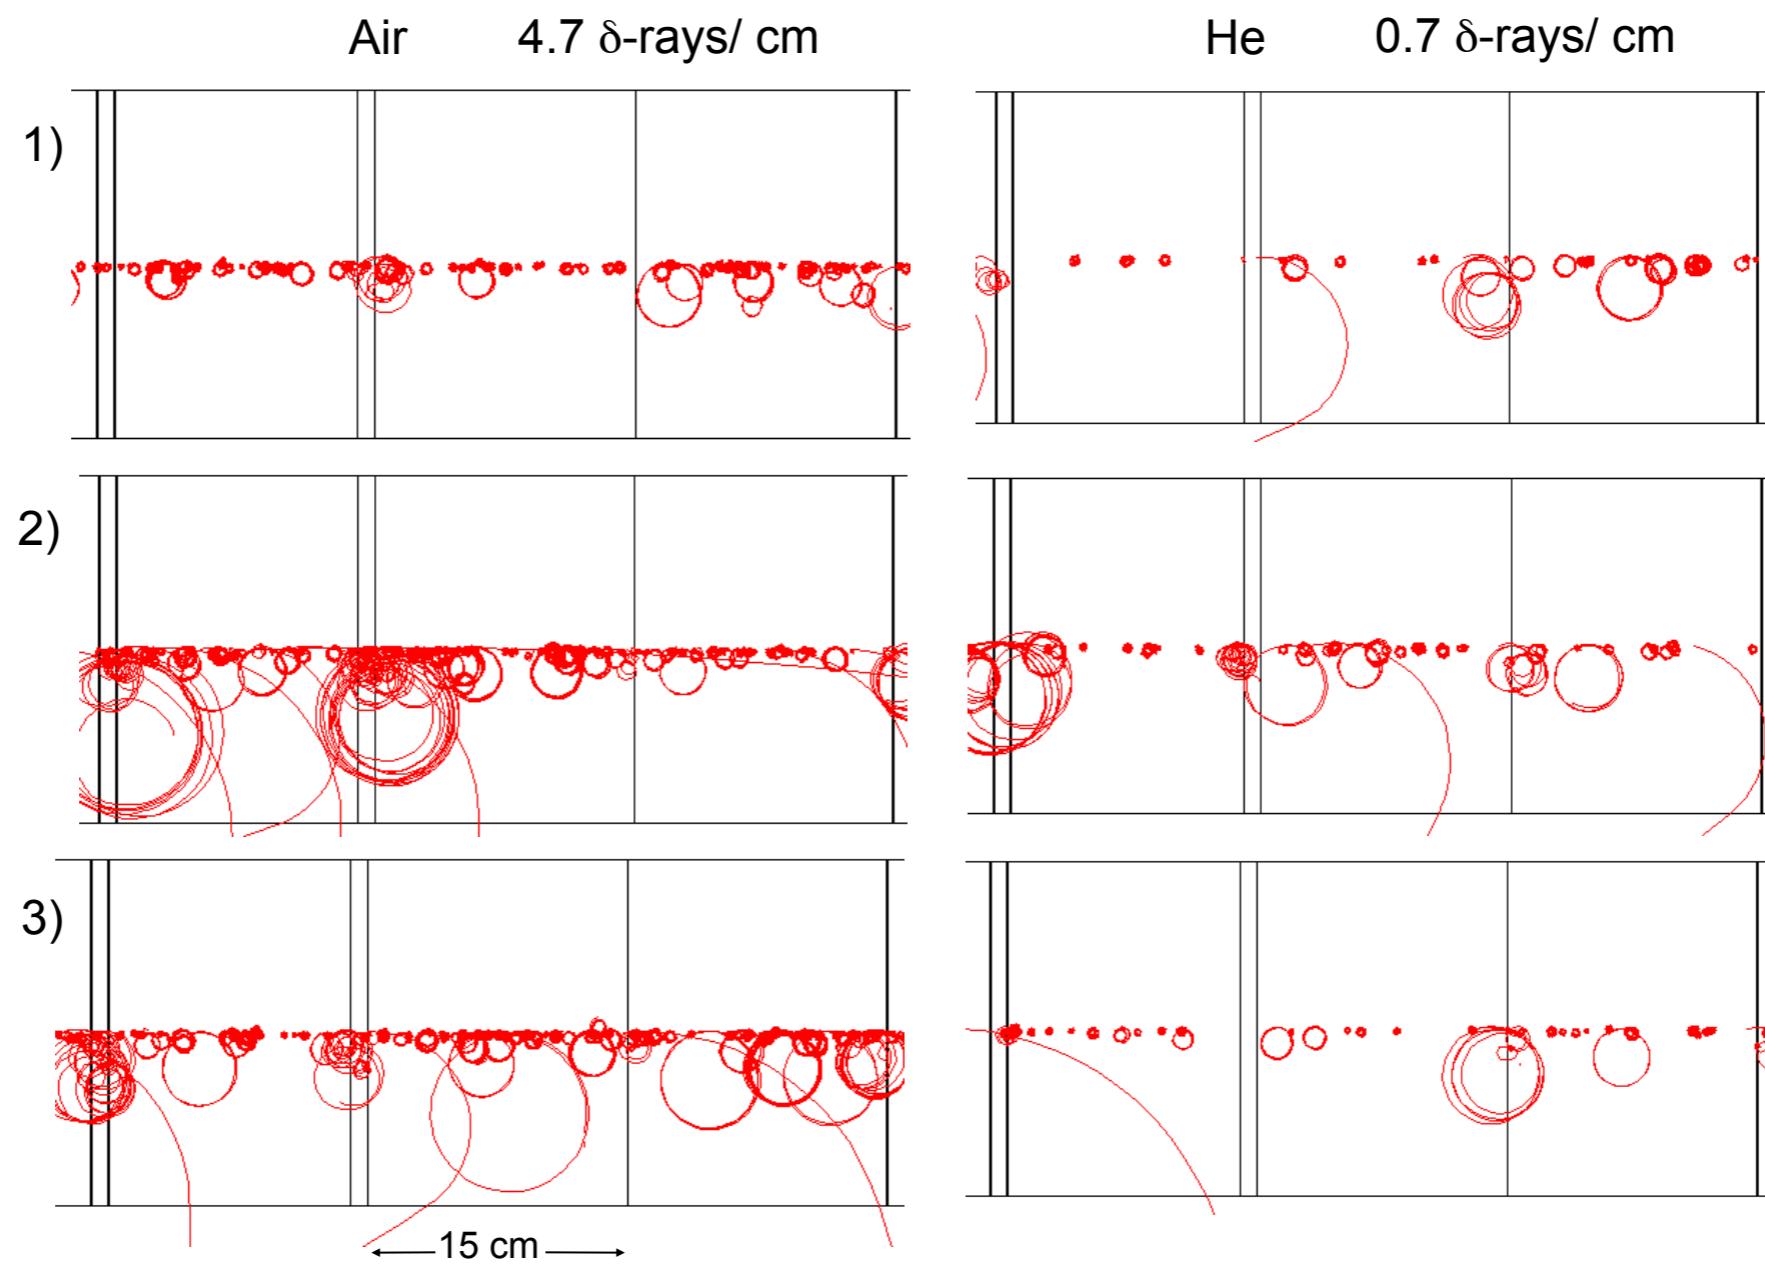

background events

# Why Vacuum?

$\delta$ -ray background in 25 ns

# Upgrade?

## **Thin silicon in Layers 1 and 2?**

- ⬢ Reduces material budget by  $0.15\% X_0$  / plane: 30% of total.
- ⬢ S/N still ~22: timing resolution degrades by only ~10%.
- ⬢ Cost: \$37.5k for silicon per copy
- ⬢ Should be possible to use same hybrids, partially populated, with a pitch adapter
- ⬢ Additional risk for parts not in hand. Risk in working with Micron, but minimal for such a small production of single-sided sensors.

# HPS? REALLY?

- ⬢ HPS:“Heavy Photon Search” - John Jaros (co-spokesperson)
- ⬢ MaDPhoX:“Massive Dark Photon Experiment” - Tim Nelson
- ⬢ MassiVE:“Massive Photon Vertex Experiment” - Maurik Holtrop

Having too much fun for a mutiny, so for now at least, HPS it is!
