

- Jacek is up and running on a hosted IPBoard (xldb-forum.slac.stanford.edu), 95% of his users are non-SLAC
- Amedeo offered 2 servers, which will be suitable for internally hosted environments - thank you.
- The 2 servers should be in bldg 50 on 1/26. John W. got a heads-up for rack/power needs.
- No forum software will satisfy all our "must-have" requirements
- Tony was able to configure FUDForum to interface with Crowd
- At this point we are recommending going with FUDForum
- FUDForum has an partial email interface
- The FUDForum test instance is available here: <http://fudforum-test.slac.stanford.edu/>
- Bob knows, that no forum software can deliver all the necessary security functions. Since risk is the (value of information)*(probability of the integrity/availability/security breach), we can control the problem by having the right information policy in place.
- List of requirements: <https://slacspace.slac.stanford.edu/sites/sccscollab/forum/default.aspx>
- Timeline (best case scenario): end of FEB - servers ready, end of March - forum ready
