V2 News

V2 is done for test of peak finders after revision r1.

See for details

- Hit/Peak Finding - description of algorithms
  - ImgAlgos.PyAlgos - peak finders API
  - PSAS-147 - details about revision 1

We work with peak finder versions v2r1, v3r1, v4r1.

Data processing and peak finding is done in cxif5315/proc-cxif5315-r0169-data-pfvn-2016-04-19.py

Peak selection parameters

- selection parameters were set with as minimal number of parameters as possible.
- selection parameters of different peak finders were adjusted to get about the same yield of peaks in the file.
from ImgAlgos.PyAlgos import PyAlgos
alg_arc = PyAlgos(windows=winds_arc, mask=mask_arc, pbits=2)
alg_arc.set_peak_selection_pars(npix_min=0, npix_max=1e6, amax_thr=0, atot_thr=500, son_min=6)  # for pfv2r1
alg_arc.set_peak_selection_pars(npix_min=0, npix_max=1e6, amax_thr=0, atot_thr=0, son_min=6)  # for pfv3r1, pfv4r1
alg_equ = ...  # the same

# in the event loop:

# run peakfinders and get list of peak records for each region
#peaks_arc = alg_arc.peak_finder_v2r1(nda, thr=30, r0=6, dr=0.5)
peaks_arc = alg_arc.peak_finder_v3r1(nda, rank=5, r0=6, dr=0.5)
#peaks_arc = alg_arc.peak_finder_v4r1(nda, thr_low=10, thr_high=150, rank=5, r0=6, dr=0.5)

#peaks_equ = alg_equ.peak_finder_v2r1(...)  # The same

Summary of peak selection parameters

peak finder specific parameters for seed peak finding
- v2: thr=30
- v3: rank=5
- v4: thr_low=10, thr_high=150, rank=5

use the same parameters for S/N calculation
- r0=6, dr=0.5

peak selection in the list
- common: son_min=6
- v2: atot_thr=500 # to keep the same number of peaks in the list as for v3,v4

Raw n-d array pre-processing before peak-finders
- get raw data
- subtract pedestals
- subtract radial background to polarization corrected data
- apply status mask
from pyimgalgos.RadialBkgd import RadialBkgd, polarization_factor

nda_bkgd = det.bkgd(runnum)  # pre-defined n-d array with averaged background from calib/.../pixel_bkgd/...
nda_smask = det.mask(runnum, calib=False, status=True, edges=True, central=True, unbond=True, unbondnbrs=True)

mask_bkgd = nda_smask * mask_winds_tot
rb = RadialBkgd(Xarr, Yarr, mask=mask_bkgd, radedges=(5200, 80000), nradbins=200, nphibins=1)
pf = polarization_factor(rb.pixel_rad(), rb.pixel_phi(), DIST_STOD)

# in the event loop:
nda_data = det.raw(evt)
if nda_data is not None:
    nda = np.array(nda_data, dtype=np.float32, copy=True)
    nda -= nda_peds

    #det.common_mode_apply(evt, nda, cmpars=(1,50,50,100))
    #nda = subtract_bkgd(nda, nda_bkgd, mask=nda_smask, winds=winds_bkgd, pbits=0)

    nda = rb.subtract_bkgd(nda.flatten() * pf)
    nda.shape = shape_cspad

    nda *= nda_smask

Common mode correction was tested before and after background subtraction.
For unknown reason it makes image visually worse...

**Peak list**

In revision 1 four parameters col_min, col_max, row_min, row_max were discarded.

For each peak finder we created list of peak parameters, beginning as
Peak list processing

For peak list processing we use script:

```
cxif5315/proc-cxif5315-r0169-peaks-from-file-v6.py
```

Peak pre-selection for histogramms

ARC region
```python
def procPeakDataArc(pk) :  
    """ Process peak for ARC region; accumulate peak statistics in histogram arrays.  
    """
    #===================
    # discard from all histograms except its own
    sp.lst_arc_atot.append(pk.atot)
    if pk.atot<2000 : return
    #===================
    sp.lst_arc_amax.append(pk.amax)
    sp.lst_arc_npix.append(pk.npix)
    sp.lst_arc_r.append(pk.r)
    ...
```

Arc: Number of pixels/peak

Entries=70277
Mean=64.67 ± 2.84

    if pk.bkgd<-20  : return False
    if pk.bkgd>50   : return False
    return True

Peak selection for fit
ARC region

Equ: Number of peaks selected

Equ: Number of peaks selected
To fit peaks we use `funcy_l1_v0(x, phi_deg, bet_deg, DoR=433/sp.DETD, sgnrt=-1.)`
EQU region
def peakIsSelectedEqu(pk) :
    """Apply peak selection criteria to each peak from file
    """
    if pk.son<9     : return False
    if pk.amax<150  : return False
    if pk.atot<2000 : return False
    if pk.npix>500  : return False
    if pk.r<100     : return False
    if pk.r>454     : return False
    if pk.rms>80    : return False
    if math.fabs(pk.bkgd)>20 : return False
    return True

To fit peaks we use funcy_l0 which automatically select solution depending on sign of parameter B.
Equ: fit parameter p1=beta

Entries: 1573
Mean = 17.66 ± 2.95
RMS = 14.81 ± 2.09
\gamma = 0.475, \chi^2 = 4.896

Equ: event fit angle beta error

Entries: 756
Mean = 2.65 ± 0.78
RMS = 2.56 ± 0.55
\gamma = 2.316, \chi^2 = 9.500

Equ: event fit angle beta error

Entries: 718
Mean = 4.57 ± 0.91
RMS = 1.92 ± 0.64
\gamma = 1.817, \chi^2 = 5.473
Equ: event fit angle phi error

Entries=1657
Mean=1.01 ± 0.20
RMS=0.83 ± 0.14
\gamma=3.088 \quad \phi=19.310
