

Saturday March 4 2006

Aim of the meeting

This will be an informal discussion on the details of what we need to do to better understand and quantify the value of combining LAT and TeV data. The idea is to try and focus on the plots and simulations/sensitivity numbers we need for this and sort out who will produce them.

In the last VRVS meeting we discussed the kinds of plots that we needed to make to understand how the LAT and TeV instruments can work together to study GRB. Fred Piron will give an [update](#) on progress in this area.
