

Traceroute Archive

To see the difference between the traceroute and rtt's for multiple days , we developed the traceroute archive. It can be accessed using the `traceroutearchive.cgi` script. It displays traceroute from a monitor node to a monitored node for any three days (which can be selected from a drop down menu). It checks loops within the traceroute and shows the changes observed in a link for the requested days. It is currently available from 5 PingER monitors including SLAC to world wide nodes monitored by SLAC at <http://www-wanmon.slac.stanford.edu/cgi-wrap/traceroutearchive.cgi>

Apart from SLAC, Historical traceroutes are available from the following monitors, from Feb 2014 onwards:

- www-wanmon.slac.stanford.edu
- pinger.cern.ch
- maggie1.seecs.edu.pk
- pinger.ictp.it
- pinger.fsktm.um.edu.my

Traceroute Archive Flow At SLAC

Following are scripts used for the traceroute archive

1. Collection of Traceroutes

1.1 autotrace.pl

This script can be found at [/afs/slac/package/pinger/autotrace.pl](http://afs/slac/package/pinger/autotrace.pl). It saves all traceroutes from the SLAC Pinger nodes to its monitored sites and runs as cronjob once every day on `pinger.slac.stanford.edu` under user `pinger..`

It uses for example <http://www-wanmon.slac.stanford.edu/cgi-bin/nph-traceroute.pl?target=www.fapesp.br> to make the traceroute

It gets the list of hosts to traceroute to by using `wget` and `pingtable.pl`.

Output is saved in `/afs/slac/package/pinger/chktrace/2011_08_24/www-wanmon.slac.stanford.edu_to_www.ab.kg_2011_08_28` as :

```

Traceroutes of all the nodes for a day are collected in date folders.

2. Display of traceroutes

2.1 traceroutearchive.cgi

This script is placed at `[/afs/slac.stanford.edu/g/www/cgi-wrap-bin/net/offsite_mon]`.

Example is

http://www.wanmon.slac.stanford.edu/cgi-wrap/traceroutearchive.cgi?from=www.wanmon.slac.stanford.edu&to=www.uda.ad&date1=2011_08_28&date2=2011_11_04&date3=2012_01_09

Note:

Difference is counted as per IP name and IP number (RTTs are excluded) between any two traceroutes.

Bandwidth needed

We estimated the bandwidth needed for historical traceroute.

- The packet sent is 140bytes and the TTL exceeded response is at least 36bytes.
- Assume an average of 20 hops and 3 tries per hop since the version of traceroute server is old and does not support options.
- Total targets is 700.
- The size of the http response page is about 5.5kb (assuming images are cached)

This totals to about 11.2 MBytes of bandwidth usage per day.
