How do I run a single test case?

How to run a single test case in maven 2.

A single test can be run by using the following command, where **classname** should be replaced by the name of the class.

```
mvn test -Dtest=[classname]
```

For instance, to run the FixedConeClustererTest, use this command.

```
mvn test -Dtest=FixedConeClustererTest
```

If you encounter a BUILD FAILURE with this command, please try the following

```
mvn test -Dtest=FixedConeClustererTest -DfailIfNoTests=false
```
