Tom's list: [Documentation update to do list](#)

Q&A via EVO meetings

Re-engage the package owners to look after their packages across OSES including unit tests and documentation

Move all builds to use Jenkins

From Tom:

- 1) Tony has to set up the Jenkin's queues and clients on build machines for the different OS's, which I think now are just 64 bit RHEL 5 and 6.
- 2) I update the runJenkins.pl script to recognize the new OS's and launch the appropriate queue.
- 3) I change one entry for each of the package/os/versionType/variant combinations to tell the RM to use Jenkins instead of the old LSF system.

The one thing the Jenkins system doesn't have at the moment is a way to clean up old builds. There is no way to trigger the deleteBuild/eraseBuild programs to run on those machines. That is about the only functionality we are lacking.
