

How do I build CLHEP

The following commands will install CLHEP 1.9.3.1 with static libraries into the */usr/local* directory.

```
wget http://proj-clhep.web.cern.ch/proj-clhep/DISTRIBUTION/distributions/clhep-1.9.3.1.tgz
tar zxvf clhep-1.9.3.1.tgz
cd 1.9.3.1/CLHEP
./configure --disable-shared --prefix=/usr/local
make
make install
```

The argument to *prefix* will be the CLHEP_BASE_DIR that should be set in the environment (e.g. for Geant4).

Change the *prefix* argument if you want a different base directory.

Once installed, the CLHEP configuration is accessible with the *clhep-config* command.
