What is SimDist and why should I use it

The SimDist package bundles together all the dependencies of SLIC into one project. This greatly simplifies the build process for end users, who do not have to manually obtain and install the 7 packages on which SLIC depends. SimDist provides a set of version tags so that there is no guess work in picking which versions of the packages to use. In addition to SLIC, SimDist will also build binaries for the simulation programs Mokka and BDSIM.
