

Build lcls2 at NERSC

Prescriptions from Chris with my comments.

Login

```
ssh -Y <username>@cori.nersc.gov  
ssh -Ycori05 # other nodes may have different versions of compilers...
```

Cloning lcls2 repository

[Version control with git](#) -describes git initialization.

The final command should be

```
git clone git@github.com:slac-lcls/lcls2.git
```

Create and activate conda environment

```
module load python
```

See available conda environments and create one:

```
conda env list  
conda env create --name <ps-0.1.1-...-environment-name> -f env_create.yaml  
source activate <ps-0.1.1-...-environment-name>
```

where the file `env_create.yaml` contains the list of require packages.

Originally it is located in https://github.com/slac-lcls/remanage/blob/master/env_create.yaml or `env_create_py2.yaml` for python2.

Our version of `env_create.yaml` has slightly modified content of the file `env_create_py2.yaml`

```
channels:  
  - defaults  
  - conda-forge  
dependencies:  
  - python=3.6  
  - cmake  
  - h5py  
  - ipython  
  - numpy  
  - cython  
  - matplotlib  
  - mongodb  
  - pymongo  
  - mpi4py  
  - nose  
  - pyzmq  
  - versioneer  
  - requests
```

Build

```
cd lcls2  
  
export CRAYPE_LINK_TYPE=dynamic  
export INSTDIR=`pwd`/install
```

For python2.7

```
./build_python2_psana.sh  
export PYTHONPATH=$INSTDIR/lib/python2.7/site-packages
```

For python3.6

```
./build_python3_light.sh  
export PYTHONPATH=$INSTDIR/lib/python3.6/site-packages
```

Useful conda commands

- conda list
- conda env list
- conda env remove --name <ps-0.1.1-...-environment-name>

Run apps etc

```
python psana(psana/pscalib/calib/MDBWebUtils.py 7  
ipython  
> import psana
```
