

Home

This is the home of the Scientific Computing Services Public (SCSPub) space. This space contains information and guidelines for SLAC users who seek high performance computing and data storage solutions for SLAC research programs and facilities. The Scientific Computing Services (SCS) team provide services and consultation based around centrally-managed, shared resources that can scale beyond individual desktops or workstations. The managed infrastructure is built on a network designed for high-throughput workloads with optimal connectivity to DOE facilities via ESnet. SCS exists to enable and foster all SLAC Science. Our priorities and goals align with the lab Mission, Vision & Values.

Mission

Scientific Computing Services provides storage and computational services that:

- fulfill current requirements and anticipate future needs of its scientific stakeholders;
- are sought after and valued;
- and achieve recognizable efficiencies through shared, common solutions.
