

MRStudio Status

May 8, 2007

From Riccardo:

MRStudio v0r4p2

1. you can now tag and rtag a package from the command line
 2. you can now run an application constituent from the command line (with an automatic source setup before)
 3. in the GUI I introduced back the tagging panel .. it is more or less the old one we have in MRvcmt, with some minor changes ..
- These features have been tested on my local box, not sure 100% they are bug free .. anycase I'm continuing this week to work on the GUI to introduce back some other nifty features and will continue to test ..
- on the linux side I'm still digging in Joanne reported problems, I'm pretty sure I'm near a solution (but I told the same one month ago and it was not true) ..
