

Set a keyboard back to QWERTY

If the keyboard on the unix terminal you're using isn't typing by the normal QWERTY combination.

Step-by-step guide

1. Go in to terminal
2. Hunt out the text to type:

```
setxkbmap us
```

3. Consider putting this in the startup file if it's not there already

Note: I haven't tested this yet. Anyone who can confirm it works please delete this info box

If this is already in a list of helpful Unix commands, please link that to this how to.
