

How to use the python script to fix smartsheet project formatting

Log into one of the SLAC linux machines ([SSH](#))

```
> cd /afs/slac/g/reseng/smartsheets
```

```
> ./check_project_gui --div=id
```

The argument to --div is either ID for instrumentation projects, or cds for controls and data systems projects.

You will need to enter your smart sheets API key in the top field, see [this page for instructions on how to setup your API key](#). Once you have an API key you can add it to your environment as SMARTSHEETS_API to avoid having to enter it manually.

Click refresh project list, choose your project and click execute script. If there are not any bad errors (crash, etc), click on "Do Fixes" and run again.
