Adding a new IEPM-BW monitoring host

1. Add the host to the NODES table.
2. Add the host to the MONHOST table.
3. Create TOOLSPEC entries for the new host based on another monitoring host with SQL like:

```
insert into TOOLSPECS (srcNodeID, destNodeID, toolName, toolPath, toolDo, testtype,
  toolOpts1, time2run, daysToAnalyze, dataToAnalyze, runInterval)
select <iepm-bw.slac.stanford.edu node ID>, <new host node ID>, toolName, toolPath, toolDo, testtype,
  toolOpts1, time2run, daysToAnalyze, dataToAnalyze, runInterval
from TOOLSPECS where destNodeID=<host to duplicate node ID>
```

4. Try to run `/afs/slac/package/netmon/bandwidth-tests/v3src/fetch-monitoring-hosts` and the new host should show up in that list.
5. Try to run `/afs/slac/package/netmon/bandwidth-tests/v3src/make-bw-html -h iepm-bw.slac.stanford.edu` and the new hosts should get its results fetched.
