

TULIP Creating the Landmark XML files

There are two landmark xml files:

1. [sites.xml](#) gives a list of landmarks which are enabled (ability=1)
2. [sites-disabled.xml](#) gives a list of landmarks which are disabled (ability=0)

They are created from the TULIP database by two [trscrontab](#) jobs running [create_sites-xml.pl](#):

```
create_sites-xml.pl > /afs/slac/www/comp/net/wan-mon/tulip/sites.xml  
create_sites-xml.pl --ability 0 > /afs/slac/www/comp/net/wan-mon/tulip/sites-disabled.xml
```

The landmarks are enabled or disabled in the TULIP database by the laundering process.

These xml files are used by [reflector.cgi](#) with the ability parameter to select the landmarks to be used.
