Observation simulation for science tools checkout

The tools in this area are **obsSim** and **orbSim**. **obsSim** has many sources available to it, some of which are described below.

(15 Oct 2004) [Sources available to obsSim](#) is a set of example XML definitions of sources. *Seth Digel*

(20 Oct 2004) **orbSim** is a simple interface to the pointing mode options that are calculated in the [GPS class](#) of the [astro](#). As far as I can tell, the comments in `astro/GPS.h` are the only documentation of these various pointing modes.
